1

Number System

FUNDAMENTAL CONCEPTS

I. Numbers

In Hindu-Arabic system, we have ten digits, namely 0, 1, 2, 3, 4, 5, 6, 7, 8 and 9.

A number is denoted by a group of digits, called numeral.

For denoting a numeral, we use the place-value chart, given below.

	Ten- Crores	Crores	Ten- Lakhs	Lakhs	Ten- Thousands	Thousands	Hundreds	Tens	Ones
(i)				5	2	8	6	7	9
(ii)			4	3	8	0	9	6	7
(iii)		3	5	2	1	8	0	0	9
(iv)	5	6	1	3	0	7	0	9	0

The four numerals shown above may be written in words as:

- (i) Five lakh twenty-eight thousand six hundred seventy-nine
- (ii) Forty-three lakh eighty thousand nine hundred sixty-seven
- (iii) Three crore fifty-two lakh eighteen thousand nine
- (iv) Fifty-six crore thirteen lakh seven thousand ninety

Now, suppose we are given the following four numerals in words:

- (i) Nine crore four lakh six thousand two
- (ii) Twelve crore seven lakh nine thousand two hundred seven
- (iii) Four lakh four thousand forty
- (iv) Twenty-one crore sixty lakh five thousand fourteen

Then, using the place-value chart, these may be written in figures as under:

		Ten-	Crores		Lakhs		Thousands	Hundreds	Tens	Ones
		Crores		Lakhs		Thousands				
	(i)		9	0	4	0	6	0	0	2
((ii)	1	2	0	7	0	9	2	0	7
(:	iii)				4	0	4	0	4	0
(iv)	2	1	6	0	0	5	0	1	4

II. Face value and Place value (or Local Value) of a Digit in a Numeral

- (i) The face value of a digit in a numeral is its own value, at whatever place it may be.
- Ex. In the numeral 6872, the face value of 2 is 2, the face value of 7 is 7, the face value of 8 is 8 and the face value of 6 is 6.
- (ii) In a given numeral:

Place value of ones digit = (ones digit) \times 1,

Place value of tens digit = (tens digit) \times 10,

Place value of hundreds digit = (hundreds digit) × 100 and so on.

Ex. In the numeral 70984, we have

Place value of $4 = (4 \times 1) = 4$,

Place value of $8 = (8 \times 10) = 80$,

Place value of $9 = (9 \times 100) = 900$,

Place value of $7 = (7 \times 10000) = 70000$.

Note: Place value of 0 in a given numeral is 0, at whatever place it may be.

III. Various Types of Numbers

1. Natural Numbers: Counting numbers are called natural numbers.

Thus, 1, 2, 3, 4, are all natural numbers.

2. Whole Numbers: All counting numbers, together with 0, form the set of whole numbers.

Thus, 0, 1, 2, 3, 4, are all whole numbers.

 \blacksquare 3. Integers: All counting numbers, zero and negatives of counting numbers, form the set of integers.

Set of positive integers = {1, 2, 3, 4, 5, 6,}

Set of negative integers = $\{-1, -2, -3, -4, -5, -6, \dots\}$

Set of all non-negative integers = {0, 1, 2, 3, 4, 5,}

4. Even Numbers: A counting number divisible by 2 is called an even number.

Thus, 0, 2, 4, 6, 8, 10, 12, etc. are all even numbers.

5. Odd Numbers: A counting number not divisible by 2 is called an odd number.

Thus, 1, 3, 5, 7, 9, 11, 13, etc. are all odd numbers.

6. Prime Numbers: A counting number is called a prime number if it has exactly two factors, namely itself and 1. **Ex.** All prime numbers less than 100 are:

2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71, 73, 79, 83, 89, 97

7. Composite Numbers: All counting numbers, which are not prime, are called composite numbers.

A composite number has more than 2 factors.

8. Perfect Numbers: A number, the sum of whose factors (except the number itself), is equal to the number, is called a perfect number, e.g. 6, 28, 496

The factors of 6 are 1, 2, 3 and 6. And, 1 + 2 + 3 = 6.

The factors of 28 are 1, 2, 4, 7, 14 and 28. And, 1 + 2 + 4 + 7 + 14 = 28.

9. Co-primes (or Relative Primes): *Two numbers whose H.C.F. is 1 are called co-prime numbers,* **Ex.** (2, 3), (8, 9) are pairs of co-primes.

10. Twin Primes: Two prime numbers whose difference is 2 are called twin-primes,

Ex. (3, 5), (5, 7), (11, 13) are pairs of twin-primes.

11. Rational Numbers: Numbers which can be expressed in the form $\frac{p}{q}$, where p and q are integers and $q \neq 0$, are called rational numbers.

Ex.
$$\frac{1}{8}$$
, $\frac{-8}{11}$, 0, 6, $5\frac{2}{3}$ etc.

12. Irrational Numbers: Numbers which when expressed in decimal would be in non-terminating and non-repeating form, are called irrational numbers.

Ex. $\sqrt{2}$, $\sqrt{3}$, $\sqrt{5}$, $\sqrt{7}$, π , e, 0.231764735.....

IV. Important Facts:

- 1. All natural numbers are whole numbers.
- 2. All whole numbers are not natural numbers.

0 is a whole number which is not a natural number.

3. Even number + Even number = Even number

Odd number + Odd number = Even number

Even number + Odd number = Odd number

Even number - Even number = Even number

Odd number – Odd number = Even number

Even number - Odd number = Odd number

Odd number – Even number = Odd number

Even number × Even number = Even number Odd number × Odd number = Odd number

Even number × Odd number = Even number

4. The smallest prime number is 2.

- **5.** The only even prime number is 2.
- **6.** The first odd prime number is 3.
- 7. 1 is a unique number neither prime nor composite.
- **8.** The least composite number is 4.
- 9. The least odd composite number is 9.
- 10. Test for a Number to be Prime:

Let *p* be a given number and let *n* be the smallest counting number such that $n^2 \ge p$.

Now, test whether p is divisible by any of the prime numbers less than or equal to n. If yes, then p is not prime otherwise, p is prime.

Ex. Test, which of the following are prime numbers?

(ii) 173 (iv) 437 (v) 811

Sol. (*i*) We know that $(12)^2 > 137$.

Prime numbers less than 12 are 2, 3, 5, 7, 11.

Clearly, none of them divides 137.

∴ 137 is a prime number.

(ii) We know that $(14)^2 > 173$.

Prime numbers less than 14 are 2, 3, 5, 7, 11, 13.

Clearly, none of them divides 173.

∴ 173 is a prime number.

(iii) We know that $(18)^2 > 319$.

Prime numbers less than 18 are 2, 3, 5, 7, 11, 13, 17.

Out of these prime numbers, 11 divides 319 completely.

∴ 319 is not a prime number.

(*iv*) We know that $(21)^2 > 437$.

Prime numbers less than 21 are 2, 3, 5, 7, 11, 13, 17, 19.

Clearly, 437 is divisible by 19.

∴ 437 is not a prime number.

(v) We know that $(30)^2 > 811$.

Prime numbers less than 30 are 2, 3, 5, 7, 11, 13, 17, 19, 23, 29.

Clearly, none of these numbers divides 811.

∴ 811 is a prime number.

V. Important Formulae:

(i) $(a + b)^2 = a^2 + b^2 + 2ab$ (ii) $(a - b)^2 = a^2 + b^2 - 2ab$

(iii) $(a + b)^2 + (a - b)^2 = 2(a^2 + b^2)$ (v) $(a + b)^3 = a^3 + b^3 + 3ab (a + b)$ (iv) $(a + b)^2 - (a - b)^2 = 4ab$

(vi) $(a - b)^3 = a^3 - b^3 - 3ab (a - b)$

(vii) $a^2 - b^2 = (a + b)(a - b)$ (viii) $(a + b + c)^2 = a^2 + b^2 + c^2 + 2(ab + bc + ca)$

(ix) $a^3 + b^3 = (a + b)(a^2 + b^2 - ab)$ (x) $a^3 - b^3 = (a - b)(a^2 + b^2 + ab)$

(xi) $a^3 + b^3 + c^3 - 3abc = (a + b + c) (a^2 + b^2 + c^2 - ab - bc - ca)$

(xii) If a + b + c = 0, then $a^3 + b^3 + c^3 = 3abc$

TESTS OF DIVISIBILITY

1. Divisibility By 2:

A number is divisible by 2 if its unit digit is any of 0, 2, 4, 6, 8.

Ex. 58694 is divisible by 2, while 86945 is not divisible by 2.

2. Divisibility By 3:

A number is divisible by 3 only when the sum of its digits is divisible by 3.

Ex. (i) In the number 695421, the sum of digits = 27, which is divisible by 3. ∴ 695421 is divisible by 3.

(ii) In the number 948653, the sum of digits = 35, which is not divisible by 3. \therefore 948653 is not divisible by 3.

3. Divisibility By 9:

A number is divisible by 9 only when the sum of its digits is divisible by 9.

Ex. (i) In the number 246591, the sum of digits = 27, which is divisible by 9.

∴ 246591 is divisible by 9.

(ii) In the number 734519, the sum of digits = 29, which is not divisible by 9. \therefore 734519 is not divisible by 9.

4. Divisibility By 4:

A number is divisible by 4 if the number formed by its last two digits is divisible by 4.

Ex. (*i*) 6879376 is divisible by 4, since 76 is divisible by 4.

(ii) 496138 is not divisible by 4, since 38 is not divisible by 4.

5. Divisibility By 8:

A number is divisible by 8 if the number formed by its last three digits is divisible by 8.

Ex. (i) In the number 16789352, the number formed by last 3 digits, namely 352 is divisible by 8. ∴ 16789352 is divisible by 8.

(ii) In the number 576484, the number formed by last 3 digits, namely 484 is not divisible by 8. \therefore 576484 is not divisible by 8.

6. Divisibility By 10:

A number is divisible by 10 only when its unit digit is 0.

- **Ex.** (*i*) 7849320 is divisible by 10, since its unit digit is 0.
 - (ii) 678405 is not divisible by 10, since its unit digit is not 0.

7. Divisibility By 5:

A number is divisible by 5 only when its unit digit is 0 or 5.

Ex. (i) Each of the numbers 76895 and 68790 is divisible by 5.

8. Divisibility By 11:

A number is divisible by 11 if the difference between the sum of its digits at odd places and the sum of its digits at even places is either 0 or a number divisible by 11.

Ex. (i) Consider the number 29435417.

(Sum of its digits at odd places) – (Sum of its digits at even places) = (7 + 4 + 3 + 9) - (1 + 5 + 4 + 2) = (23 - 12) = 11, which is divisible by 11.

:. 29435417 is divisible by 11.

(ii) Consider the number 57463822.

(Sum of its digits at odd places) – (Sum of its digits at even places)

= (2 + 8 + 6 + 7) - (2 + 3 + 4 + 5) = (23 - 14) = 9, which is not divisible by 11.

∴ 57463822 is not divisible by 11.

9. Divisibility By 25:

A number is divisible by 25 if the number formed by its last two digits is either 00 or divisible by 25.

- Ex. (i) In the number 63875, the number formed by last 2 digits, namely 75 is divisible by 25. ∴ 63875 is divisible by 25.
 - (ii) In the number 96445, the number formed by last 2 digits, namely 45 is not divisible by 25. ∴ 96445 is not divisible by 25.

10. Divisibility By 7 or 13:

Divide the number into groups of 3 digits (starting from right) and find the difference between the sum of the numbers in odd and even places. If the difference is 0 or divisible by 7 or 13 (as the case may be), it is divisible by 7 or 13.

Ex. (i) $4537792 \rightarrow 4 / 537 / 792$

(792 + 4) - 537 = 259, which is divisible by 7 but not by 13.

 \therefore 4537792 is divisible by 7 and not by 13.

(ii) $579488 \rightarrow 579 / 488$

579 - 488 = 91, which is divisible by both 7 and 13.

:. 579488 is divisible by both 7 and 13.

11. Divisibility By 16:

A number is divisible by 16, if the number formed by its last 4 digits is divisible by 16.

- Ex. (i) In the number 463776, the number formed by last 4 digits, namely 3776, is divisible by 16. ∴ 463776 is divisible by 16.
 - (ii) In the number 895684, the number formed by last 4 digits, namely 5684, is not divisible by 16. ∴ 895684 is not divisible by 16.
- **12. Divisibility By 6:** A number is divisible by 6, if it is divisible by both 2 and 3.
- 13. Divisibility By 12: A number is divisible by 12, if it is divisible by both 3 and 4.
- **14. Divisibility By 15:** A number is divisible by 15, if it is divisible by both 3 and 5.
- **15. Divisibility By 18:** A number is divisible by 18, if it is divisible by both 2 and 9.
- **16. Divisibility By 14:** A number is divisible by 14, if it is divisible by both 2 and 7.
- 17. Divisibility By 24: A given number is divisible by 24, if it is divisible by both 3 and 8.
- **18.** Divisibility By 40: A given number is divisible by 40, if it is divisible by both 5 and 8.
- **19. Divisibility By 80:** A given number is divisible by 80, if it is divisible by both 5 and 16.

Note: If a number is divisible by p as well as q, where p and q are co-primes, then the given number is divisible by pq.

If p and q are not co-primes, then the given number need not be divisible by pq, even when it is divisible by both p and q.

Ex. 36 is divisible by both 4 and 6, but it is not divisible by $(4 \times 6) = 24$, since 4 and 6 are not co-primes.

VI. Factorial of a Number

Let n be a positive integer.

Then, the continued product of first n natural numbers is called factorial n, denoted by n! or $\lfloor \underline{n} \rfloor$.

Thus,
$$n! = n(n-1)(n-2)$$
.......... 3.2.1

Ex.
$$5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$$
.

Note: 0 ! = 1

VII. Modulus of a Number

$$|x| = \begin{cases} x, & \text{when } x \ge 0 \\ -x, & \text{when } x < 0 \end{cases}$$

Ex.
$$|-5| = 5$$
, $|4| = 4$, $|-1| = 1$, etc.

VIII. Greatest Integral Value

The greatest integral value of an integer x, denoted by [x], is defined as the greatest integer not exceeding x.

Ex.
$$[1.35] = 1$$
, $\left[\frac{11}{4}\right] = \left[2\frac{3}{4}\right] = 2$, etc.

IX. Multiplication BY Short cut Methods

1. Multiplication By Distributive Law:

(i)
$$a \times (b + c) = a \times b + a \times c$$
 (ii) $a \times (b - c) = a \times b - a \times c$

Ex. (*i*)
$$567958 \times 99999 = 567958 \times (100000 - 1) = 567958 \times 100000 - 567958 \times 1 = (56795800000) - 567958) = 56795232042.$$

(ii)
$$978 \times 184 + 978 \times 816 = 978 \times (184 + 816) = 978 \times 1000 = 978000$$
.

2. Multiplication of a Number By 5^n : Put n zeros to the right of the multiplicand and divide the number so formed by 2^n .

Ex.
$$975436 \times 625 = 975436 \times 5^4 = \frac{9754360000}{16} = 609647500.$$

X. Division Algorithm or Euclidean Algorithm

If we divide a given number by another number, then:

Dividend = (Divisor × Quotient) + Remainder

Important Facts:

- **1.** (i) $(x^n a^n)$ is divisible by (x a) for all values of n.
 - (ii) $(x^n a^n)$ is divisible by (x + a) for all even values of n.
 - (iii) $(x^n + a^n)$ is divisible by (x + a) for all odd values of n.

2. To find the highest power of a prime number p in n!

Highest power of
$$p$$
 in $n! = \left[\frac{n}{p}\right] + \left[\frac{n}{p^2}\right] + \left[\frac{n}{p^3}\right] + \dots + \left[\frac{n}{p^r}\right]$, where $p^r \le n < p^{r+1}$

SOLVED EXAMPLES

(LIC, ADO, 2007)

(ii) Given exp =
$$715632 - (631104 + 9874 + 99)$$

= $715632 - 641077 = 74555$.
 631104 715632
 9874 $- \frac{641077}{74555}$

1)2)

5 P 9

3 R 7

2 Q 8

- Ex. 2. What value will replace the question mark in each of the following questions?

 (i)? 1936248 = 1635773 (ii) 9587 -? = 7429 4358
 - Sol. (i) Let x 1936248 = 1635773 (ii) 9367 7 = 7429 4338 (ii) Let 9587 x = 7429 4358 (ii) Let 9587 x = 7429 4358.

Then, $9587 - x = 3071 \Rightarrow x = 9587 - 3071 = 6516$.

Ex. 3. What could be the maximum value of Q in the following equation? 5P9 + 3R7 + 2Q8 = 1114

Sol. We may analyse the given equation as shown:

Clearly, 2 + P + R + Q = 11.

So, the maximum value of Q can be (11 - 2), i.e. 9 (when P = 0, R = 0).

- **Ex. 4.** Simplify: (i) 5793405 × 9999
- (ii) 839478×625
- **Sol.** (i) $5793405 \times 9999 = 5793405 \times (10000 1) = 57934050000 5793405 = 57928256595.$

(ii)
$$839478 \times 625 = 839478 \times 5^4 = 839478 \times \left(\frac{10}{2}\right)^4 = \frac{839478 \times 10^4}{2^4} = \frac{8394780000}{16} = 524673750.$$

- **Ex. 5.** Evaluate: (i) $986 \times 137 + 986 \times 863$
- (ii) $983 \times 207 983 \times 107$
- **Sol.** (i) $986 \times 137 + 986 \times 863 = 986 \times (137 + 863) = 986 \times 1000 = 986000$.
 - (ii) $983 \times 207 983 \times 107 = 983 \times (207 107) = 983 \times 100 = 98300$.
- **Ex. 6.** Simplify: (i) 1605×1605
- $(ii) 1398 \times 1398$

Sol. (i)
$$1605 \times 1605 = (1605)^2 = (1600 + 5)^2 = (1600)^2 + 5^2 + 2 \times 1600 \times 5$$

= $2560000 + 25 + 16000 = 2576025$.

- (ii) $1398 \times 1398 = (1398)^2 = (1400 2)^2 = (1400)^2 + 2^2 2 \times 1400 \times 2$ = 1960000 + 4 - 5600 = 1954404.
- Ex. 7. Evaluate: (i) $475 \times 475 + 125 \times 125$
- (ii) $796 \times 796 204 \times 204$

Sol. (i) We have
$$(a^2 + b^2) = \frac{1}{2}[(a+b)^2 + (a-b)^2]$$

$$\therefore (475)^2 + (125)^2 = \frac{1}{2} \cdot [(475 + 125)^2 + (475 - 125)^2] = \frac{1}{2} \cdot [(600)^2 + (350)^2]$$

$$= \frac{1}{2}[360000 + 122500] = \frac{1}{2} \times 482500 = 241250.$$

(ii)
$$796 \times 796 - 204 \times 204 = (796)^2 - (204)^2 = (796 + 204) (796 - 204)$$

= $(1000 \times 592) = 592000$.

 $[\because (a-b)^2 = (a+b)(a-b)]$

- Ex. 8. Simplify: (i) $(387 \times 387 + 113 \times 113 + 2 \times 387 \times 113)$
 - (ii) $(87 \times 87 + 61 \times 61 2 \times 87 \times 61)$

Sol. (*i*) Given Exp. =
$$(387)^2 + (113)^2 + 2 \times 387 \times 113 = (a^2 + b^2 + 2ab)$$
, where $a = 387$ and $b = 113$ = $(a + b)^2 = (387 + 113)^2 = (500)^2 = 250000$.

(ii) Given Exp. =
$$(87)^2 + (61)^2 - 2 \times 87 \times 61 = (a^2 + b^2 - 2ab)$$
, where $a = 87$ and $b = 61$
= $(a - b)^2 = (87 - 61)^2 = (26)^2 = (20 + 6)^2 = (20)^2 + 6^2 + 2 \times 20 \times 6 = (400 + 36 + 240)$
= $(436 + 240) = 676$.

Ex. 9. Find the square root of $4a^2 + b^2 + c^2 + 4ab - 2bc - 4ac$.

(Campus Recruitment, 2010)

Sol.
$$\sqrt{4a^2 + b^2 + c^2 + 4ab - 2bc - 4ac} = \sqrt{(2a)^2 + b^2 + (-c)^2 + 2 \times 2a \times b + 2 \times b \times (-c) + 2 \times (2a) \times (-c)}$$

= $\sqrt{(2a + b - c)^2} = (2a + b - c)$.

Ex. 10. A is counting the numbers from 1 to 31 and B from 31 to 1. A is counting the odd numbers only. The speed of both is the same. What will be the number which will be pronounced by A and B together?

(Campus Recruitment, 2010)

Sol. The numbers pronounced by *A* and *B* in order are:

A	1	3	5	7	9	11	13	15	17	19	21	23	25	27	29	31
В	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Clearly both A and B pronounce the number 21 together.

Ex. 11. Simplify: (i) $\frac{789 \times 789 \times 789 + 211 \times 211}{789 \times 789 - 789 \times 211 + 211 \times 211}$ (ii) $\frac{658 \times 658 \times 658 - 328 \times 328 \times 328}{658 \times 658 + 658 \times 328 + 328 \times 328}$ Sol. (i) Given exp. = $\frac{(789)^3 + (211)^3}{(789)^2 - (789 \times 211) + (211)^2} = \frac{a^3 + b^3}{a^2 - ab + b^2}$ (where a = 789 and b = 211)

= (a + b) = (789 + 211) = 1000.(ii) Given exp. $= \frac{(658)^3 - (328)^3}{(658)^2 + (658 \times 328) + (328)^2} = \frac{a^3 - b^3}{a^2 + ab + b^2},$ (where a = 658 and b = 328) = (a - b) = (658 - 328) = 330.

Ex. 12. Simplify: $\frac{(893 + 786)^2 - (893 - 786)^2}{(893 \times 786)}$

Sol. Given exp. = $\frac{(a+b)^2 - (a-b)^2}{ab}$ (where a = 893, b = 786) = $\frac{4ab}{ab} = 4$.

Ex. 13. Which of the following are prime numbers?

(i) 241 (ii) 337

(iii) 391 (iv) 571

Sol. (*i*) Clearly, $16 > \sqrt{241}$.

Prime numbers less than 16 are 2, 3, 5, 7, 11, 13.

241 is not divisible by any of them.

∴ 241 is a prime number.

- (ii) Clearly, $19 > \sqrt{337}$. Prime numbers less than 19 are 2, 3, 5, 7, 11, 13, 17. 337 is not divisible by any one of them.
 - ∴ 337 is a prime number.
- (iii) Clearly, $20 > \sqrt{391}$. Prime numbers less than 20 are 2, 3, 5, 7, 11, 13, 17, 19.

We find that 391 is divisible by 17.

- :. 391 is not a prime number.
- (*iv*) Clearly, $24 > \sqrt{571}$. Prime numbers less than 24 are 2, 3, 5, 7, 11, 13, 17, 19,23. 571 is not divisible by any one of them.
 - \therefore 571 is a prime number.

Ex. 14. If Δ stands for the operation 'adding first number to twice the second number', then find the value of $(1 \Delta 2) \Delta 3$.

Sol. $(1 \ \Delta \ 2) \ \Delta \ 3 = (1 + 2 \times 2) \ \Delta \ 3 = 5 \ \Delta \ 3 = 5 + 2 \times 3 = 5 + 6 = 11.$

Ex. 15. Given that $1^2 + 2^2 + 3^2 + \dots + 10^2 = 385$, then find the value of $2^2 + 4^2 + 6^2 + \dots + 20^2$.

Sol. $2^2 + 4^2 + 6^2 + \dots + 20^2 = 2^2 (1^2 + 2^2 + 3^2 + \dots + 10^2) = 2^2 \times 385 = 4 \times 385 = 1540.$

Ex.16. Which of the following numbers is divisible by 3?

(i) 541326 (ii) 596701

- **Sol.** (*i*) Sum of digits in 541326 = (5 + 4 + 1 + 3 + 2 + 6) = 21, which is divisible by 3. Hence, 541326 is divisible by 3.
 - (ii) Sum of digits in 5967013 = (5 + 9 + 6 + 7 + 0 + 1 + 3) = 31, which is not divisible by 3. Hence, 5967013 is not divisible by 3.

Ex. 17. What least value must be assigned to * so that the number 197*5462 is divisible by 9?

Sol. Let the missing digit be x.

Sum of digits = (1 + 9 + 7 + x + 5 + 4 + 6 + 2) = (34 + x).

For (34 + x) to be divisible by 9, x must be replaced by 2.

Hence, the digit in place of * must be 2.

Ex. 18. Which of the following numbers is divisible by 4?

- (i) 67920594 (ii) 618703572
- **Sol.** (*i*) The number formed by the last two digits in the given number is 94, which is not divisible by 4. Hence, 67920594 is not divisible by 4.
 - (ii) The number formed by the last two digits in the given number is 72, which is divisible by 4. Hence, 618703572 is divisible by 4.

Ex. 19. Which digits should come in place of * and \$ if the number 62684*\$ is divisible by both 8 and 5?

Sol. Since the given number is divisible by 5, so 0 or 5 must come in place of \$. But, a number ending with 5 is never divisible by 8. So, 0 will replace \$.

Now, the number formed by the last three digits is 4*0, which becomes divisible by 8, if * is replaced by 4. Hence, digits in place of * and \$ are 4 and 0 respectively.

Ex. 20. Show that 4832718 is divisible by 11.

Sol. (Sum of digits at odd places) – (Sum of digits at even places) = (8 + 7 + 3 + 4) - (1 + 2 + 8) = 11, which is divisible by 11.

Hence, 4832718 is divisible by 11.

Ex. 21. Is 52563744 divisible by 24?

Sol. $24 = 3 \times 8$, where 3 and 8 are co-primes.

The sum of the digits in the given number is 36, which is divisible by 3. So, the given number is divisible by 3.

The number formed by the last 3 digits of the given number is 744, which is divisible by 8. So, the given number is divisible by 8. Thus, the given number is divisible by both 3 and 8, where 3 and 8 are co-primes. So, it is divisible by 3×8 , i.e. 24.

Ex. 22. What are the values of M and N respectively if M39048458N is divisible by both 8 and 11, where M and N are single-digit integers?

Sol. Since the given number is divisible by 8, it is obvious that the number formed by the last three digits, i.e. 58N is divisible by 8, which is possible only when N = 4.

Now, (sum of digits at even places) - (sum of digits at odd places)

=
$$(8 + 4 + 4 + 9 + M) - (4 + 5 + 8 + 0 + 3)$$

= $(25 + M) - 20 = M + 5$, which must be divisible by 11.

So, M = 6.

Hence, M = 6, N = 4.

Ex. 23. Find the number of digits in the smallest number which is made up of digits 1 and 0 only and is divisible by 225.

Sol. $225 = 9 \times 25$, where 9 and 25 are co-primes.

Clearly, a number is divisible by 225 if it is divisible by both 9 and 25.

Now, a number is divisible by 9 if the sum of its digits is divisible by 9 and a number is divisible by 25 if the number formed by the last two digits is divisible by 25.

:. The smallest number which is made up of digits 1 and 0 and divisible by 225 = 111111111100.

Hence, number of digits = 11.

Ex. 24. If the number 3422213pq is divisible by 99, find the missing digits p and q.

Sol. $99 = 9 \times 11$, where 9 and 11 are co-primes.

Clearly, a number is divisible by 99 if it is divisible by both 9 and 11.

Since the number is divisible by 9, we have:

$$(3 + 4 + 2 + 2 + 2 + 1 + 3 + p + q) = a$$
 multiple of 9

$$\Rightarrow$$
 17 + $(p + q) = 18$ or 27

$$\Rightarrow p+q=1$$
 ...(i) or $p+q=10$...(ii)

...(iv)

Since the number is divisible by 11, we have:

$$(q + 3 + 2 + 2 + 3) - (p + 1 + 2 + 4) = 0$$
 or a multiple of 11

$$\Rightarrow$$
 (10 + q) - (7 + p) = 0 or 11

$$\Rightarrow$$
 3 + $(q - p) = 0$ or 11

$$\Rightarrow q - p = -3$$

or
$$q - p = 8$$

$$\Rightarrow p - q = 3$$
 ...(iii) or $q - p = 8$

Clearly, if (i) holds, then neither (iii) nor (iv) holds. So, (i) does not hold.

Also, solving (ii) and (iii) together, we get: p = 6.5, which is not possible.

Solving (ii) and (iv) together, we get: p = 1, q = 9.

Ex. 25. x is a positive integer such that $x^2 + 12$ is exactly divisible by x. Find all the possible values of x.

Sol.
$$\frac{x^2 + 12}{x} = \frac{x^2}{x} + \frac{12}{x} = x + \frac{12}{x}$$

Clearly, 12 must be completely divisible by x.

So, the possible values of x are 1, 2, 3, 4, 6 and 12.

- Ex. 26. Find the smallest number to be added to 1000 so that 45 divides the sum exactly.
 - Sol. On dividing 1000 by 45, we get 10 as remainder.
 - \therefore Number to be added = (45 10) = 35.
- Ex. 27. What least number must be subtracted from 2000 to get a number exactly divisible by 17?
 - Sol. On dividing 2000 by 17, we get 11 as remainder.
 - :. Required number to be subtracted = 11.
- Ex. 28. Find the number which is nearest to 3105 and is exactly divisible by 21.
 - Sol. On dividing 3105 by 21, we get 18 as remainder.
 - .. Number to be added to 3105 = (21 18) = 3.

Hence, required number = 3105 + 3 = 3108.

- Ex. 29. Find the smallest number of five digits which is exactly divisible by 476.
 - **Sol.** Smallest number of 5 digits = 10000.

On dividing 10000 by 476, we get 4 as remainder.

 \therefore Number to be added = (476 - 4) = 472.

Hence, required number = 10472.

- Ex. 30. Find the greatest number of five digits which is exactly divisible by 47.
 - **Sol.** Greatest number of 5 digits is 99999.

On dividing 99999 by 47, we get 30 as remainder.

- \therefore Required number = (99999 30) = 99969.
- Ex. 31. When a certain number is multiplied by 13, the product consists entirely of fives. Find the smallest such number.
 - **Sol.** Clearly, we keep on dividing 55555...... by 13 till we get 0 as remainder.
 - :. Required number = 42735.
- Ex. 32. When a certain number is multiplied by 18, the product consists entirely of 2's. What is the minimum number of 2's in the product?
 - **Sol.** We keep on dividing 22222...... by 18 till we get 0 as remainder. Clearly, number of 2's in the product = 9.
- Ex. 33. Find the smallest number which when multiplied by 9 gives the product as 1 followed by a certain number of 7s only.
 - **Sol.** The least number having 1 followed by 7s, which is divisible by 9, is 177777, as 1 + 7 + 7 + 7 + 7 + 7 = 36 (which is divisible by 9).
 - \therefore Required number = 177777 ÷ 9 = 19753.
- Ex. 34. What is the unit's digit in the product?

81 × 82 × 83 × 89?

- **Sol.** Required unit's digit = Unit's digit in the product $1 \times 2 \times 3 \times \dots \times 9 = 0$ [:: $2 \times 5 = 10$]
- Ex. 35. Find the unit's digit in the product $(2467)^{153} \times (341)^{72}$.
 - **Sol.** Clearly, unit's digit in the given product = unit's digit in $7^{153} \times 1^{72}$.

Now, 7⁴ gives unit digit 1.

- \therefore 7¹⁵² gives unit digit 1.
- \therefore 7¹⁵³ gives unit digit (1 × 7) = 7. Also, 1⁷² gives unit digit 1.

Hence, unit digit in the product = $(7 \times 1) = 7$.

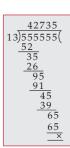

- Ex. 36. Find the unit's digit in $(264)^{102} + (264)^{103}$.
 - **Sol.** Required unit's digit = unit's digit in $(4)^{102} + (4)^{103}$.

Now, 4² gives unit digit 6.

- \therefore (4)¹⁰² gives unit digit 6.
- $(4)^{103}$ gives unit digit of the product (6×4) i.e., 4.

Hence, unit's digit in $(264)^{102} + (264)^{103} = \text{unit's digit in } (6 + 4) = 0.$

- Ex. 37. Find the total number of prime factors in the expression $(4)^{11} \times (7)^5 \times (11)^2$.
 - **Sol.** $(4)^{11} \times (7)^5 \times (11)^2 = (2 \times 2)^{11} \times (7)^5 \times (11)^2 = 2^{11} \times 2^{11} \times 7^5 \times 11^2 = 2^{22} \times 7^5 \times 11^2$.
 - \therefore Total number of prime factors = (22 + 5 + 2) = 29.

12345679 18)222222222 (

162

Ex. 38. What is the number of zeros at the end of the product of the numbers from 1 to 100?

Sol. Let
$$N = 1 \times 2 \times 3 \times ... \times 100$$
.

Clearly, only the multiples of 2 and 5 yield zeros on multiplication.

In the given product, the highest power of 5 is much less than that compared to 2. So, we shall find the highest power of 5 in N.

Highest power of 5 in
$$N = \left[\frac{100}{5}\right] + \left[\frac{100}{5^2}\right] = 20 + 4 = 24$$
.
Hence, required number of zeros = 24.

Ex. 39. What is the number of zeros at the end of the product $5^5 \times 10^{10} \times 15^{15} \times \dots \times 125^{125}$?

Sol. Clearly, the highest power of 2 is less than that of 5 in N.

So, the highest power of 2 in *N* shall give us the number of zeros at the end of *N*.

Highest power of $2 = \text{Number of multiples of } 2 + \text{Number of multiples of 4 (i.e. } 2^2) +$

Number of multiples of 8 (i.e.
$$2^3$$
) + Number of multiples of 16 (i.e. 2^4) = $[(10 + 20 + 30 + \dots + 120) + (20 + 40 + 60 + \dots + 120) + (40 + 80 + 120) + 80]$ = $(780 + 420 + 240 + 80) = 1520$.

Hence, required number of zeros = 1520.

Ex. 40. On dividing 15968 by a certain number, the quotient is 89 and the remainder is 37. Find the divisor.

Sol. Divisor =
$$\frac{\text{Dividend} - \text{Remainder}}{\text{Quotient}} = \frac{15968 - 37}{89} = 179.$$

- Ex. 41. A number when divided by 114, leaves remainder 21. If the same number is divided by 19, find the remainder. (S.S.C., 2010)
 - **Sol.** On dividing the given number by 114, let *k* be the quotient and 21 the remainder.

Then, number =
$$114 k + 21 = 19 \times 6k + 19 + 2 = 19 (6k + 1) + 2$$
.

- :. The given number when divided by 19 gives remainder = 2.
- Ex. 42. A number being successively divided by 3, 5 and 8 leaves remainders 1, 4 and 7 respectively. Find the respective remainders if the order of divisors be reversed.

Sol.
$$3 \times \frac{x}{5 + y - 1}$$
 $\therefore z = (8 \times 1 + 7) = 15$; $y = (5 z + 4) = (5 \times 15 + 4) = 79$; $x = (3y + 1) = (3 \times 79 + 1) = 238$.

Now, $8 \times 238 \times \frac{5 \times 29 - 6}{3 \times 5 - 4} \times \frac{5 \times 29 -$

- :. Respective remainders are 6, 4, 2.
- Ex. 43. Three boys A, B, C were asked to divide a certain number by 1001 by the method of factors. They took the factors in the orders 13, 11, 7; 7, 11, 13 and 11, 7, 13 respectively. If the first boy obtained 3, 2, 1 as successive remainders, then find the successive remainders obtained by the other two boys B and C.

Sol.
$$\frac{13}{11} \frac{x}{y-3}$$
 $\therefore z = 7 \times 1 + 1 = 8$, $\frac{7}{z-2}$ $y = 11 z + 2 = 11 \times 8 + 2 = 90$; $1-1$ $x = 13$ $y + 3 = 13 \times 90 + 3 = 1173$. Now, $\frac{7}{1173} \frac{11}{167-4}$ So, B obtained 4, 2 and 2 as successive remainders. And, $\frac{11}{1173} \frac{1173}{7 \cdot 106-7}$ $\frac{106-7}{13 \cdot 15-1}$ C obtained 7, 1 and 2 as successive remainders.

Ex. 44. In a division sum, the divisor is ten times the quotient and five times the remainder. If the remainder is 46, determine the dividend.

Sol. Remainder = 46; Divisor =
$$5 \times 46 = 230$$
; Quotient = $\frac{230}{10} = 23$.

- \therefore Dividend = Divisor \times Quotient + Remainder = 230 \times 23 + 46 = 5336.
- Ex. 45. If three times the larger of the two numbers is divided by the smaller one, we get 4 as quotient and 3 as remainder. Also, if seven times the smaller number is divided by the larger one, we get 5 as quotient and 1 as remainder. Find the numbers.
 - **Sol.** Let the larger number be x and the smaller number be y.

Then,
$$3x = 4y + 3 \Rightarrow 3x - 4y = 3$$
 ...(*i*)

And,
$$7y = 5x + 1 \Rightarrow -5x + 7y = 1$$
 ...(ii)

Multiplying (i) by 5 and (ii) by 3, we get:

$$15x - 20y = 15$$
 ...(iii) and $-15x + 21y = 3$...(iv)

Adding (iii) and (iv), we get: y = 18.

Putting y = 18 in (i), we get: x = 25.

Hence, the numbers are 25 and 18.

- Ex. 46. A number when divided by 6 leaves remainder 3. When the square of the same number is divided by 6, find the remainder.
 - **Sol.** On dividing the given number by 6, let *k* be the quotient and 3 the remainder.

Then, number = 6k + 3.

Square of the number
$$= (6k + 3)^2 = 36k^2 + 9 + 36k = 36k^2 + 36k + 6 + 3$$

= 6 $(6k^2 + 6k + 1) + 3$, which gives a remainder 3 when divided by 6.

- Ex. 47. Find the remainder when $9^6 + 7$ is divided by 8.
 - **Sol.** $(x^n a^n)$ is divisible by (x a) for all values of n.

So,
$$(9^6 - 1)$$
 is divisible by $(9 - 1)$, i.e. $8 \Rightarrow (9^6 - 1) + 8$ is divisible by $8 \Rightarrow (9^6 + 7)$ is divisible by 8. Hence, required remainder = 0.

- Ex. 48. Find the remainder when $(397)^{3589} + 5$ is divided by 398.
 - **Sol.** $(x^n + a^n)$ is divisible by (x + a) for all odd values of n.

So,
$$[(397)^{3589} + 1]$$
 is divisible by $(397 + 1)$, i.e. 398

$$\Rightarrow$$
 [{(397)³⁵⁸⁹ + 1} + 4] gives remainder 4 when divided by 398

$$\Rightarrow$$
 [(397)³⁵⁸⁹ + 5] gives remainder 4 when divided by 398.

Ex. 49. If 7¹²⁶ is divided by 48, find the remainder.

Sol.
$$7^{126} = (7^2)^{63} = (49)^{63}$$
.

Now, since
$$(x^n - a^n)$$
 is divisible by $(x - a)$ for all values of n , so $[(49)^{63} - 1]$ or $(7^{126} - 1)$ is divisible by $(49 - 1)$ i.e. 48.

- \therefore Remainder obtained when $(7)^{126}$ is divided by 48 = 1.
- Ex. 50. Find the remainder when $(257^{166} 243^{166})$ is divided by 500. Sol. $(x^n a^n)$ is divisible by (x + a) for all even values of n.

$$\therefore$$
 (257¹⁶⁶ – 243¹⁶⁶) is divisible by (257 + 243), i.e. 500.

Hence, required remainder = 0.

- **Ex. 51.** Find a common factor of $(127^{127} + 97^{127})$ and $(127^{97} + 97^{97})$.
 - **Sol.** $(x^n + a^n)$ is divisible by (x + a) for all odd values of n.

$$\therefore$$
 (127¹²⁷ + 97¹²⁷) as well as (127⁹⁷ + 97⁹⁷) is divisible by (127 + 97), i.e. 224.

Hence, required common factor = 224.

Ex. 52. A 99-digit number is formed by writing the first 59 natural numbers one after the other as: 1234567891011121314......5859

Find the remainder obtained when the above number is divided by 16.

Sol. The required remainder is the same as that obtained on dividing the number formed by the last four digits i.e. 5859 by 16, which is 3.

42.	Between two distinct rational numbers a ar	nd b , there
	exists another rational number which is	(P.C.S., 2006)

(a)
$$\frac{a}{2}$$

(b)
$$\frac{b}{2}$$

(c)
$$\frac{ab}{2}$$

$$(d) \ \frac{a+b}{2}$$

43. If B > A, then which expression will have the highest value (given that A and B are positive integers)?

(Campus Recruitment, 2007)

(a)
$$A - B$$

(b) AB

$$(c) A + B$$

(d) Can't say

44. If 0 < x < 1, which of the following is greatest?

(Campus Recruitment, 2007)

(b) x^2

(c)
$$\frac{1}{x}$$

$$(d) \ \frac{1}{x^2}$$

45. If p is a positive fraction less than 1, then

(a) $\frac{1}{n}$ is less than 1

(b) $\frac{1}{n}$ is a positive integer

- (c) p^2 is less than p
- (d) $\frac{2}{p} p$ is a positive number
- **46.** If x is a real number, then $x^2 + x + 1$ is
 - (a) less than $\frac{3}{4}$
 - (b) zero for at least one value of x
 - (c) always negative
 - (d) greater than or equal to $\frac{3}{4}$
- 47. Let *n* be a natural number such that $\frac{1}{2} + \frac{1}{3} + \frac{1}{7} + \frac{1}{n}$

is also a natural number. Which of the following statements is not true? (A.A.O. Exam, 2009)

- (a) 2 divides n
- (b) 3 divides n
- (c) 7 divides n
- (d) n > 84

48. If n is an integer, how many values of n will give an integral value of $\left(\frac{16n^2 + 7n + 6}{n}\right)$?

(c) 4

- (d) None of these
- **49.** If p > q and r < 0, then which is true?
 - (a) pr < qr
- (b) p r < q r
- (c) p + r < q + r
- (d) None of these
- **50.** If X < Z and X < Y, which of the following is necessarily true?
 - I. Y < Z
- II. $X^2 < YZ$
- III. ZX < Y + Z
- (a) Only I
- (b) Only II
- (c) Only III
- (d) None of these

51. In the relation x > y + z, x + y > p and z < p, which of the following is necessarily true?

(Campus Recruitment, 2008)

(a) y > p

(b) x + y > z

(c) y + p > x

(d) Insufficient data

52. If a and b are positive integers and $\frac{(a-b)}{3.5} = \frac{4}{7}$ then

(a) b > a

(Campus Recruitment, 2010)

(b) b < a

(c) b = a

(d) $b \ge a$

53. If $13 = \frac{13 w}{(1-w)}$, then $(2w)^2 = ?$

(Campus Recruitment, 2009)

(a) $\frac{1}{4}$

(c) 1

(d) 2

Directions (Questions 54–57): For a 5–digit number, without repetition of digits, the following information is available.

(B.B.A., 2006)

- (i) The first digit is more than 5 times the last digit.
- (ii) The two-digit number formed by the last two digits is the product of two prime numbers.
- (iii) The first three digits are all odd.
- (iv) The number does not contain the digits 3 or 0 and the first digit is also the largest.
- 54. The second digit of the number is
 - (a) 5

- (c) 9
- (d) Cannot be determined
- 55. The last digit of the number is
 - (a) 0
- (c) 2
- 56. The largest digit in the number is
- (b) 7

- (c) 8
- (d) 9
- 57. Which of the following is a factor of the given number?
 - (a) 2
- (b) 3
- (c) 4
- (d) 9
- **58.** The least prime number is
 - (a) 0 (c) 2
- (b) 1 (d) 3
- **59.** Consider the following statements:
 - 1. If x and y are composite numbers, then x + y is always composite.
 - 2. There does not exist a natural number which is neither prime nor composite.

Which of the above statements is/are correct?

- (a) 1 only
- (*b*) 2 only
- (c) Both 1 and 2
- (d) Neither 1 nor 2
- **60.** The number of prime numbers between 0 and 50 is
 - (a) 14

(b) 15

- (c) 16
- (d) 17

(a) 3	24					QUANTITATIVE APTITUDE
220. Which of the following numbers is divisible by 3, 7, 9 and 11? 221. A number 476**0 is divisible by both 3 and 11. The non-zero digits in the hundred's and ten's place respectively are (a) 7, 4 (b) 5, 3 (c) 15, 2 (d) None of these 222. How many of the following numbers are divisible by 3 but not by 9? 2133, 2343, 3474, 4131, 5286, 5340, 6336, 7347, 8115, 9276 (d) Sone of these 223. If the number 357*25* is divisible by both 3 and 5, then the missing digits in the unit's place and the thousandth's place respectively are (a) 0, 5, 4 (d) None of these 224. 6897 is divisible by (b) 5, 1 (d) None of these 225. 6997 is divisible by both 3 and 5, then the missing digits in the unit's place and the thousandth's place respectively are (a) 0, 5, 4 (d) None of these 226. 6897 is divisible by (b) 11 and 19 (d) neither 11 nor 19 225. Which of the following numbers is exactly divisible by 24? (d) 35718 (e) 63810 (e) 537804 (d) 3125736 (e) 637804 (d) 3125736 (e) 13 only (d) all 7, 11 and 13 (d) divisible by 11 but not by 3 (e) divisible by 3 nor by 11 (e) 13 only (d) all 7, 11 and 13 (d) divisible by 50 (d) 8 (d) 12 (d) 3 (d) 40 (d) 8 (d) 14 (d) 8 (d) 15 (d) 16 (d) 17 (d) 18		(a) 3	(b) 4	231.	If x and y are two digits of	of the number 653 <i>xy</i> such
 7, 9 and 11? (a) 639 (b) 2079 (c) 3791 (d) 37911 211. A number 476*0 is divisible by both 3 and 11. The non-zero digits in the hundred's and ten's place respectively are (a) 7, 4 (b) 5, 2 (d) None of these 222. How many of the following numbers are divisible by 3 but not by 9? 2133, 2343, 3474, 4131, 5286, 5340, 6336, 7347, 8115, 9276 (a) 5 (b) 6 (c) 7 (d) None of these 223. If the number 357*25* is divisible by both 3 and 5, then the missing digits in the unit's place and the thousandth's place respectively are (a) 0, 6 (b) 5, 1 (c) 5, 5 4 (d) None of these 224. 6897 is divisible by (b) 19 only (c) both 11 and 19 (d) neither 11 nor 19 225. Which of the following numbers is exactly divisible by 247 (a) 35718 (b) 63810 (c) 537804 (d) 3125736 226. The number 31313113131313131 is (a) neither divisible by 3 but not by 11 (d) divisible by 10 but not by 3 (c) divisible by 3 but not by 11 (d) divisible by 10 but not by 3 (e) divisible by 10 than the three divisible by 547 (27) 325325 is a six-digit number served as X must have the value (a) 0 (b) 537804 (d) 3125736 (c) 5 - 4 (d) None of these 236. If the seven-digit number 876937q is divisible by 225, then the values of p and q respectively are (a) 0 and 0 (b) 0 and 0 (c) 0 and 5 (d) 7 and 8 (c) 5 and 8 (d) 7 and 8 (e) 5 and 8 (f) 9 (g) 1 and 10 (g) 0 wisible by 10 and 11 (g) divisible by 11 the not by 3 (e) divisible by 10 and 11 (f) divisible by 10 and 11 (g) 0 wisible by 11 and 13 (g) 0 wisible by 10 and 11 (g) 0 wisible by 10 and 11			(d) 6			
 7, 9 and 11? (a) 639 (b) 2079 (c) 3791 (d) 37911 The non-zero digits in the hundred's and ten's place respectively are (a) 7, 4 (b) 5, 2 (d) None of these 222. How many of the following numbers are divisible by 3 but not by 9? 2133, 2243, 3474, 4131, 5286, 5340, 6336, 7347, 8115, 9276 (a) 5 (b) 6 (c) 7 (d) None of these 223. If the number 357°25° is divisible by both 3 and 5, then the missing digits in the unit's place and the thousandth's place respectively are (a) 0, 6 (b) 5, 1 (c) 5, 5, 4 (d) None of these 224. 6897 is divisible by (a) 11 only (b) both 11 and 19 (d) neither 11 nor 19 225. Which of the following numbers is exactly divisible by 24² (e) 35718 (f) 63810 (c) 537804 (d) 3125736 (d) 63703 (d) 9 and 5 (d) 9 and 5 (d) 9 and 5 (e) 6 (f) 7 and 8 (f) 5 and 8 (f) 7 and 8 (g) 8 (g) 10 (g) 144 (g) 25 (h) 16 (d) 14 (g) 8 (h) 19 (g) 13 (g) 14 (d) 232. The six-digit number 5ABE7A is a multiple of 33 for non-zero digits A and B. Which of the following numbers are divisible by 99? (d) 143445 (e) 135792 (f) 13744 (g) 135792 (g) 2, 6 (g) 1, 9 (g) 2, 6 (h) 7 (g) 2, 6 (h) 8 (l) 19 (g) 2, 6 (h) 6 (h) 6 (h) 6 (h) 6 (h) 7 (h) 6 (h) 7 (h) 6 (h) 8 (l) 9 (l) 1, 37 (l) 4 (l) 1, 37 (l) 1,	220.	Which of the following r	numbers is divisible by 3,		equal to	
221. A number 476*0 is divisible by both 3 and 11. The non-zero digits in the hundred's and ten's place respectively are (a) 7, 4 (b) 5, 3 (c) 5, 2 (d) None of these (222. How many of the following numbers are divisible by 3 but not by 9? 2133, 2343, 3474, 4131, 5286, 5340, 6336, 7347, 8115, 276 (a) 5 (b) 6 (c) 7 (d) None of these (223. If the number 357*25* is divisible by both 3 and 5, then the missing digits in the unit's place and the thousandth's place respectively are (a) 0, 6 (b) 5, 1 (c) 5, 5 4 (d) None of these (224. 6897 is divisible by (a) 11 only (b) 19 only (c) both 11 and 19 (d) neither 11 nor 19 (225. Which of the following numbers is exactly divisible by 224 (e) 235718 (b) 63810 (c) 537804 (d) 3125736 (d) 31131131131131131131131 (d) divisible by 3 but not by 11 (d) divisible by 10 both 3 and 11 (d) divisible by 3 but not by 11 (d) divisible by 10 both 3 and 11 (d) divisible by 10 both 3 and 11 (d) divisible by 10 that not by 3 (e) divisible by 10 that not by 3 (e) 13 only (d) all 7, 11 and 13 (then X is (d) 1 (d) 22 (d) 18 (d) 22 (d) 18 (d) 27 (d) 28 (d) 29 (d) 3 (d) 8 (d) 29 (d) 3 (d) 8 (d) 4 (d) 5 (d) 5 (d) 8 (d) 7 (d) 8 (d) 4 (d) 6 (d) 7 (d) 8 (d) 4 (d) 6 (d) 7 (d) 8 (d) 4 (d) 6 (d) 7 (d) 8 (,		(a) 3	(b) 4
221. A number 476***0 is divisible by both 3 and 11. The non-zero digits in the hundred's and ten's place respectively are (a) 7, 4 (b) 5, 3 (c) 5, 2 (d) None of these 2130, 2243, 3474, 4131, 5286, 5340, 6336, 7347, 8115, 9276 (a) 5 (b) 6 (c) 7 (d) None of these 223. If the number 357*25* is divisible by both 3 and 5, then the missing digits in the unit's place and the housandth's place respectively are (a) 0, 6 (b) 5, 1 (c) 5, 4 (d) None of these 224. 6897 is divisible by (a) 11 only (b) 19 only (c) both 11 and 19 (d) neither 11 nor 19 (e) 537804 (d) 3125736 (e) 357804 (d) 3125736 (e) 357804 (d) 3125736 (e) 537804 (d) 3125736 (e) 63810 (e) 537804 (d) 3125736 (e) 63810 (e) 633700 (d) 9 (d) 9 (e) 6 (f) 7 (d) 4 ((a) 639	(b) 2079		(c) 5	(d) 6
221. A number 476**0 is divisible by both 3 and 11. The non-zero digits in the hundred's and ten's place respectively are (a) 7, 4 (b) 5, 2 (d) None of these 222. How many of the following numbers are divisible by 3 but not by 9? 2133, 2343, 3474, 4131, 5286, 5340, 6336, 7347, 8115, 9276 (a) 5 (b) 6 (c) 7 (d) None of these 223. If the number 357**25* is divisible by both 3 and 5, then the missing digits in the unit's place and the thousandth's place respectively are (a) 0, 6 (c) 5, 4 (d) None of these 224. 6897 is divisible by (a) 11 only (b) 19 only (c) both 11 and 19 (d) neither 11 nor 19 Which of the following numbers is exactly divisible by 24? (a) 35718 (b) 63810 (c) 537804 (d) 332736 226. The number 313113131313131311 is (a) neither divisible by 3 nor by 11 (b) divisible by 11 but not by 3 (c) divisible by 11 but not by 3 (d) divisible by 11 tut not by 3 (d) divisible by 11 tut not by 3 (d) 13 only (d) 3 and 3 (d) 4 (d) 6 (e) 7 (d) 8 (e) 9 (f) 0 (d) 4 (d) 14 (d) 4145 (d) 14345 (b) 13572404 234.  312. Two numbers when divided by a certain divisor leave the remainders 4375 and 2986 respectively but when the sum of two numbers is divided by the same divisor, the remainder is 2361. The divisor in question is (a) 4675 (b) 4900 (c) 5000 (d) None of these (c) 5000 (d) None of these (d) 16 (b) 13 (e) 5000 (d) None of these (d) 16 (b) 18 (e) 28 (d) 40 313. A number divided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (b) 2 (c) 3 (d) 4 322. What is the remainder with part of the provided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (b) 18 (c) 28 (d) 40 314. The number N, giving the same remainder. The sum of the digits of N is (a) 10 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3355 (b) 5355 (b) 5355 (d) 5555 (c) 5535 (d) 5555 (c) 5535 (d) 5555 (d) 5535 (d) 5555 (e) 5535 (d) 5555 (f) 560 (d) 10 (d) 10 (d) 12 (d) 2 (d) 3 318. A number when divided by 3 leaves a remainder 1 (d) 10 (d) 12 (d) 12 (d) 2 (d) 3 319. If n is even, (6" – 1) is divisible by (a) (c) 2 (d) 3 (d) 37 (d) 11 (d) 2 (d) 2 (d) 3 (d) 37 (d) 11 (d) 2 (d) 2 (d) 3 (d) 37 (d) 3		(c) $r_1 - r_2 + r_3$	(a) $r_1 + r_2 - r_3$		(a) 0	(b) 1
leave the remainders 4375 and 2986 respectively but when the sum of two numbers is divided by the same divisor, the remainder is 2361. The divisor in question is (a) 4675 (b) 4900 (c) 5000 (d) None of these 313. A number divided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a remainder 1. When the quotient is divided by 2, it leaves a remainder 1. When the quotient is divided by 2, it leaves a remainder 1. When the quotient is divided by 2, it leaves a remainder 1. When the quotient is divided by 5? (a) 1 (c) 20 (d) 1 (d) 1 (e) 1 (e) 3 (d) 4 (d) 4 (d) 4 (d) 10 (e) 2 (d) 1 (e) 2 (f) 3 (d) 8 (f) 1 (f) 1 (f) 2 (f) 2 (f) 3 (d) 8 (f) 1 (f) 2 (f) 2 (f) 3 (d) 1 (f) 1 (f) 2 (f) 3 (d) 1 (f) 3 (240				(c) 3	(d) None of these
(a) 1 (b) 2 (c) 16 (d) 17 (d) 17 (e) 26 (c) 16 (d) 17 (d) 17 (e) 18 (e) 16 (d) 17 (d) 17 (e) 18 (e)	312.			321.	If 17 ²⁰⁰ is divided by 18,	the remainder is
the same divisor, the remainder is 2361. The divisor in question is (a) 4675 (b) 4900 (c) 5000 (d) None of these 313. A number divided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a leaves a remainder of the same number is a constant of the same number is 3356. A number when divided by 3 leaves a remainder of 1. When the quotient is divided by 2, it leaves a leaves a remainder of 2 and 3 and 2 and 3					· ·	
322. What is the remainder when 2 ³¹ is divided by 5? (a) 4675 (b) 4900 (c) 5000 (d) None of these 313. A number divided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5335 (c) 5535 (d) 358. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a remainder 1 and if the quotient is divided by 2, it leaves a remainder 1 and if the quotient is divided by 2, it leaves a remainder 1 and if the quotient is divided by 2, it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the quotient is divided by 2. it leaves a remainder 1 and if the					` '	
(a) 4675 (b) 4900 (c) 5000 (d) None of these (c) 5000 (d) None of these 313. A number divided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (c) 28 (d) 40 (d) 40 (e) 2. (d) 40 (e) 28 (d) 40 (f)			nainder is 2361. The divisor	222		* *
(c) 5000 (d) None of these 313. A number divided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the quotient is divided by 2, it leaves a land of the provision of a land of th		=	(1) 1000	322.		
 313. A number divided by 13 leaves a remainder 1 and if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 66? (a) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a life if the number is in the quotient is divided by 2, it leaves a life if the number is in the quotient is divided by 2, it leaves a life if the number is in the quotient is divided by 2, it leaves a life if the number is in the quotient is divided by 2, it leaves a life in the number is in the quotient is divided by 2, it leaves a life in the quotient is divided by 2, it leaves a life in the quotient is divided by 3, leaves a remainder in the quotient is divided by 3, leaves a remainder in the quotient is divided by 2, it leaves a life in the quotient is divided by 3, leaves a remainder in the quotient is divided by 2, it leaves a life in the quotient is divided			* *			• •
if the quotient, thus obtained, is divided by 5, we get a remainder of 3. What will be the remainder if the number is divided by 65? (a) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (c) 5535 (d) 3553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a		* /				` '
k is a positive integer. (2) $a^n - b^n$ is divisible by $a - b$ if $n = 2k$, where k is a positive integer. (2) $a^n - b^n$ is divisible by $a - b$ if $n = 2k$, where k is a positive integer. (2) $a^n - b^n$ is divisible by $a - b$ if $n = 2k$, where k is a positive integer. (3) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N , giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9 , 11 , 13 leaves the remainders 8 , 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8 , 9 (b) 10, 1 , 6 (c) 8 , 9 , 8 (d) 9 , 8 , 8 316. After the division of a number successively by 3 , 4 and 7 , the remainders obtained are 2 , 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8 , 7 and 3 giving residues 3 , 4 and 2 respectively and quotient 31 . The number is (a) 3555 (b) 5355 (c) 5535 (d) 35553 318. A number when divided by 3 leaves a remainder 3 the number when divided by 3 leaves a remainder 3 the number is divided by 3 leaves a remainder 3 then 4 is divisible by 4 and 4 in 4	313.			323.	9	
(2) $a^n - b^n$ is divisible by $a - b$ if $n = 2k$, where k is a positive integer. (3) 16						
a positive integer. (a) 16 (b) 18 (c) 28 (d) 40 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a						
(c) 28			T			a - b if $n = 2k$, where k is
 314. The numbers 2272 and 875 are divided by a three-digit number N, giving the same remainder. The sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5535 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a light three digits of N is (a) 1 only (b) 2 only (c) Both 1 and 2 (d) Neither 1 nor 2 324. (7¹⁹ + 2) is divided by 6. The remainder is (a) 1 (b) 2 (c) 3 (d) 5 325. If (10¹² + 25)² - (10¹² - 25)² = 10ⁿ, then the value on is (a) 5 (b) 10 (c) 14 (d) 20 326. (3²⁵ + 3²⁶ + 3²⁷ + 3²⁸) is divisible by (a) 1 (b) 16 (c) 25 (d) 30 327. (4⁶¹ + 4⁶² + 4⁶³ + 4⁶⁴) is divisible by (a) 1 (b) 11 (c) 13 (d) 17 328. (9⁶ + 1) when divided by 8, would leave a remainder of (a) 0 (b) 11 (c) 2 (d) 3 329. If n is even, (6ⁿ - 1) is divisible by (a) 3 (a) 1 only (b) 13 (c) 3 (d		` '	* /			
digit number <i>N</i> , giving the same remainder. The sum of the digits of <i>N</i> is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a			* *		Which of the statements g	given above is/are correct?
 sum of the digits of N is (a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5535 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a remainder is divided by 3. leaves a remainder is divided by 4. It leaves a remainder is divided by 6. The remainder is (a) 1 (b) 2 (c) 3 (c) 3 (d) 5 (d) 5 (e) 14 (d) 20 (a) 5 (b) 10 (c) 14 (d) 20 (a) 5 (b) 16 (c) 25 (d) 30 326. (3²5 + 3²6 + 3²7 + 3²8) is divisible by (a) 11 (b) 16 (c) 25 (d) 30 (d) 5 (e) 14 (e) 25 (d) 30 (e) 14 (e) 25 (d) 30 (e) 14 (e) 14 (e) 25 (d) 30 (e) 14 (e) 24 (e) 14 (e) 25 (d) 30 (e) 14 (e) 25 (d) 40 (e) 25 (d) 40 (e) 25 (d) 40 (e) 25 (d) 40 (e) 25 (e) 14 (e) 14 (e) 24 (e) 14 (314.		•			(b) 2 only
(a) 10 (b) 11 (c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a leave						
(c) 12 (d) 13 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a				324.	$(7^{19} + 2)$ is divided by 6.	The remainder is
 315. A number when divided by three consecutive numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2. it leaves a leave and a single process of the remainders of the remainders 8, 9 and 8 in is (a) 5 (b) 10 (c) 14 (d) 20 326. (3²⁵ + 3²⁶ + 3²⁷ + 3²⁸) is divisible by (a) 11 (c) 25 (d) 30 327. (4⁶¹ + 4⁶² + 4⁶³ + 4⁶⁴) is divisible by (a) 3 (d) 17 328. (9⁶ + 1) when divided by 8, would leave a remainder of (a) 0 (b) 1 (c) 2 (d) 3 329. If n is even, (6ⁿ - 1) is divisible by (a) 6 (b) 30 (c) 35 (d) 37 330. If (12ⁿ + 1) is divisible by 13, then n is (a) 1 only (b) 12 only 					(a) 1	(b) 2
numbers 9, 11, 13 leaves the remainders 8, 9 and 8 respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a large of the remainders 8, 9 and 8 respectively. He are remainders of the remainders of the remainders of the remainders is reversed, the remainders (R.R.B., 2008) (a) 5 (b) 10 (c) 14 (d) 20 326. (3 ²⁵ + 3 ²⁶ + 3 ²⁷ + 3 ²⁸) is divisible by (a) 11 (b) 16 (c) 25 (d) 30 (d) 17 (2) 13 (d) 17 (2) 13 (d) 17 (2) 2 (d) 3 (d) 3 (e) 329. If n is even, (6 ⁿ – 1) is divisible by (a) 6 (b) 30 (c) 35 (d) 37 (d) 37 (d) 37 (d) 39 (e) 3555 (d) 37 (f) 12 ⁿ + 1) is divisible by 13, then n is (a) 1 only (b) 12 only						
respectively. If the order of divisors is reversed, the remainders will be (R.R.B., 2008) (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a leaves a remainder 1. When the quotient is divided by 2, it leaves a leaves a remainder of the	315.			325.	If $(10^{12} + 25)^2 - (10^{12} - 25)^2$	$)^2 = 10^n$, then the value of
remainders will be (a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a language of the property of the					n is	
(a) 10, 8, 9 (b) 10, 1, 6 (c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. A number when divided by 3 leaves a remainder 1. When the quotient is divided by 2, it leaves a					(a) 5	(b) 10
(c) 8, 9, 8 (d) 9, 8, 8 316. After the division of a number successively by 3, 4 and 7, the remainders obtained are 2, 1 and 4 respectively. What will be the remainder if 84 divides the same number? (a) 41 (b) 53 (c) 75 (d) 80 317. A number is successively divided by 8, 7 and 3 giving residues 3, 4 and 2 respectively and quotient 31. The number is (a) 3555 (b) 5355 (c) 5535 (d) 5553 318. (c) 1296

- (d) 1400
- **366.** If $p^3 q^3 = (p q)(p q)^2 xpq$, then find the value [SSC—CHSL (10 + 2) Exam, 2015]

(a) 1

(b) -3

(c) 3

(d) -1

367. What minimum value should be assigned to *, so that 2361*48 is exactly divisible by 9?

[ESIC—UDC Exam, 2016]

(a) 2

(b) 3

(c) 9

(d) 4

368. If p, q, r are all real numbers then $(p-q)^3 + (q-r)^3 + (r-p)^3$ [SSC-CAPF/CPOExam, 2016] is equal to

(a) (p-q)(q-r)(r-p)

(b) 3(p-q)(q-r)(r-p)

(c) 1

(d) 0

369. If $(a^2 - b^2) \div (a + b) = 25$, then (a + b) = ?

(a) 30

(c) 125

(d) 150

[RRB-NTPC Exam, 2016]

370. How many prime numbers are there between 100 to 200? [CMAT, 2017]

(a) 21

(b) 20

(c) 16

(d) 11

371. The least number of five digit is exactly divisible by 88 is

(a) 10032

(b) 10132

(c) 10088

(d) 10023

[SSC Multi-Tasking Staff Exam -2017]

372. The number of three digit numbers which are multiples of 9 are

[CLAT, 2016]

(a) 100

(b) 99

(c) 98

(d) 101

373. Two consecutive even positive integers, sum of the squares of which is 1060, are

[CLAT, 2016]

(a) 12 and 14

(b) 20 and 22

(c) 22 and 24

(d) 15 and 18

Directions (Question 374): The question below consists of a question and two statements numbered I and II given below it. You have to decide whether the data given in the statements are sufficient to answer the questions. Read both the statements and given answer.

- (A) If the data in statement I alone is sufficient to answer the question, while the data in statement II alone is not sufficient to answer the question.
- (B) If the data in statement II alone is sufficient to answer the question, while the data in statement I alone is not sufficient to answer the question.
- (C) If the data either in statement I alone or statement II alone is sufficient to answer the questions.
- (D) If the data given in both Statement I and II together are not sufficient to answer the question.
- (E) If the data in both Statement I and II together are necessary to answer the question.
- **374.** What is the number of trees planted in the field in row and column?

[IBPS—Bank Spl. Officer (Marketing) Exam, 2016]

- I. Number of columns is more than the number of rows by 4.
- II. Number of columns is 20.

375. If *n* is a natural number and $n = p_1^{x_1} p_2^{x_2} p_3^{x_3}$, where p_1 , p_2 , p_3 are distinct prime factors, then the number of prime factors for *n* is

[CDS, 2016]

(a) $x_1 + x_2 + x_3$

(b) x_1, x_2, x_3

- (c) $(x_1 + 1) (x_2 + 1) (x_3 + 1)$ (d) None of the above
- **376.** Consider the following statements for the sequence of numbers given below:

11, 111, 1111, 11111,

- 1. Each number can be expressed in the form (4m + 3), where m is a natural number.
- 2. Some numbers are squares.

Which of the above statements is/are correct?

[CDS, 2016]

(a) 1 only

(b) 2 only

(c) Both 1 and 2

- (d) neither 1 nor 2)
- **377.** If the sum of two numbers is 14 and their difference is 10. Find the product of these two numbers.

[UPSSSC Lower Subordinate (Pre.) Exam, 2016]

(a) 24

(b) 22

(c) 20

(d) 18

378. If m = -4, n = -2, then the value of $m^3 - 3m^2 + 3m + 3n + 3n^2 + n^3$ is

(a) -120

(b) -124

(c) -126

(d) -128

[SSC—CGL (Tier-I) Exam, 2015]

379. If the sum of two numbers is 14 and their difference is 10, find the product of these two numbers.

[UPSSSC—Lower Subordinate (Pre.) Exam 2016]

(a) 18

(b) 20

(c) 24

(d) 22

380. What is the sum of all natural numbers from 1 to 100? [CLAT-2016]

(a) 5050

(b) 6000

(c) 5000

(d) 5052

SOLUTIONS

T-ThThН 0 3 5 4 0

Place value of $5 = (5 \times 10000) = 50000$.

- 2. The face value of 8 in the given numeral is 8.
- **3.** Sum of the place values of 3 = (3000 + 30) = 3030.
- **4.** Difference between the place values of 7 and 3 in given numeral = (7000 - 30) = 6970.
- 5. Difference between the local value and the face value of 7 in the given numeral = (70000 - 7) = 69993.
- **6.** Required sum = (99999 + 10000) = 109999.
- 7. Required difference = (10000 999) = 9001.
- 8. Required number = 30005.
- 9. Required number = 2047.
- 10. All natural numbers and 0 are called the whole numbers.
- 11. Clearly, there exists a smallest natural number, namely 1. So statement (1) is true.

Natural numbers are counting numbers and the counting process never ends. So, the largest nature number is not known. Thus, statement (2) is false.

Thre is no natural number between two consecutive natural numbers. So, statement (3) is false.

- 12. Clearly, every rational number is also a real number.
- **13.** Clearly, π is an irrational number.
- **14.** Since $\sqrt{2}$ is a non-terminating and non-repeating decimal, so it is an irrational number.
- 15. $\sqrt{3}$ is an infinite non-recurring decimal.
- **16.** We can write 9 = (1 + 8); 9 = (2 + 7); 9 = (3 + 6), 9 = (4 + 5).

Thus, it can be done in 4 ways.

17. We may have (64 and 1), (32 and 2), (16 and 4) and (8 and 8).

In any case, the sum is not 35.

18. We may take the least values of y and z as y = 1 and z = 1.

So, the maximum value of *x* is 7. **19.** We know that: $1^2 + 2^2 + 3^2 + ... + n^2 = \frac{1}{6} n (n + 1) (2n + 1).$

$$\therefore (1^2 + 2^2 + 3^2 + \dots + 9^2) = \left(\frac{1}{6} \times 9 \times 10 \times 19\right) = 285.$$

20. $(n + 7) = 88 \Rightarrow n = (88 - 7) = 81$, which is false as 20 < n < 80.

So, the required number is 88.

- **21.** We have, $\hat{M} = 1000$; D = 500; C = 100 and L = 50. \therefore M > D > C > L is the correct sequence.
- 22. These numbers are 24, 22, 20, 18, 16, 14, 12, 10, 8, 6, 4, 2. 8th number from the bottom is 16.
- 23. The given series is such that the sum of first hundred terms is zero, and 101st term is 2. So, the sum of 101 terms
- **24.** Given series is 1, 2, 3, 4, 1, 2, 3, 4, 1, 2, 3, 4, \therefore 96th term is 4. So, $T_{97} = 1$ and $T_{98} = 2$. Hence, the 98th
- **25.** Let the hundred's, ten's and one's digits be x, y and zrespectively.

Then, the given number is 100 x + 10 y + z.

26. Let the thousand's, hundred's, ten's and one's digits be x, y, z, w respectively.

Then, the number is $1000 x + 100 y + 10 z + w = 10^3 x +$ $10^2 y + 10 z + w$.

- 27. We know that the sum of two odd numbers is even.
- $(n \text{ is odd}, p \text{ is odd}) \Rightarrow (n + p) \text{ is even}.$ **28.** n^3 is odd $\Rightarrow n$ is odd and n^2 is odd.

:. I and II are true.

- **29.** (n-1) is odd $\Rightarrow (n-1)-2$ and (n-1)+2 are odd \Rightarrow (n-3) and (n+1) are odd.
- 30. The product of two odd numbers is always odd.
- **31.** x is odd $\Rightarrow x^2$ is odd $\Rightarrow 5x^2$ is odd $\Rightarrow (5x^2 + 2)$ is odd.
- **32.** $ab = 0 \Rightarrow a = 0$ or b = 0 or both are zero.
- **33.** $A < B < C < D \Rightarrow D > B > A$ Also, A < B < C < D and $D > B > E \Rightarrow E < B < C < D$ $\Rightarrow E < C < D \text{ and } E < B < C.$

Clearly, we cannot arrange A, E, C is an increasing or decreasing order.

- **34.** When *m* is even, then m(n + 'o')(p q) is even.
- **35.** $n < 0 \Rightarrow 2n < 0, -n > 0$ and $n^2 = (-n)^2 > 0$. Thus, out of the numbers 0, – n, 2n and n^2 we find that 2*n* is the least.
- **36.** It is given that x y = 8.
 - I. We may have x = 5 and y = -3.

So, it is not necessary that both x and y are positive.

- II. If x is positive, then it is not necessary that y is positive, as $x = 5 \Rightarrow y = -3$.
- III. If x < 0, then y = x 8 which is clearly less than 0. So, if x is negative, then y must be negative.
- **37.** If x < 0 and y < 0, then clearly xy > 0.

So, whenever x and y are negative, then xy is positive. Note that (x < 0, y < 0) does not imply that (x + y) is positive.

e.g. If x = -2 and y = -3, then (x + y) = -5 < 0. Note that (x < 0, y < 0) does not imply that (x - y) > 0. e.g. If x = -5 and y = -2, then x - y = -5 - (-2)= -5 + 2 = -3 < 0.

38. Let n = 1 + x = 1 + m (m + 1) (m + 2) (m + 3), where mis a positive integer.

Then, clearly two of m, (m + 1), (m + 2), (m + 3) are even and so their product is even. Thus, *x* is even and hence n = 1 + x is odd.

Also, $n = 1 + m (m + 3) (m + 1) (m + 2) = 1 + (m^2 + 3m)$ $(m^2 + 3m + 2)$

 $\Rightarrow n = 1 + y (y + 2)$, where $m^2 + 3m = y$

 $\Rightarrow n = 1 + y^2 + 2y = (1 + y)^2$, which is a perfect square.

Hence, I and III are true.

39. $1 \le x \le 2 \Rightarrow 1 \le \frac{2}{5}y + 3 \le 2$ $\Rightarrow (1-3) \le \frac{2}{5}y \le (2-3) \Rightarrow \frac{5}{2}(1-3) \le y \le \frac{5}{2}(2-3)$ \Rightarrow $-5 \le y \le \frac{-5}{2}$.

Hence, y increases from – 5 to $\frac{-5}{2}$.

- **40.** (a) Let x = 0 and $y = \sqrt{2}$. Then, x is rational and y is irrational.
 - \therefore $x + y = 0 + \sqrt{2} = \sqrt{2}$ which is irrational. Thus, x + y is not rational.

- (b) Let x = 0 and $y = \sqrt{2}$. Then, x is rational and y is irrational.
- $\therefore \quad xy = 0 \times \sqrt{2} = 0, \text{ which is rational.}$

Hence, *xy* is not irrational.

- (c) As shown in (b), xy is not necessarily irrational.
- (d) x + y is necessary irrational. But xy can be either rational or irrational.

Hence, (d) is true.

- **41.** Let x and (x + 1) be two consecutive integers. Then $(x + 1)^2 x^2 = (x + 1 + x) (x + 1 x) = (x + 1 + x) \times 1 = (x + 1 + x) = \text{sum of given numbers.}$
- 42. If a and b are two rational numbers, then $\frac{a+b}{2}$ is a rational number lying between a and b.
- **43.** $B > A \Rightarrow A < B \Rightarrow (A B) < 0$. Since *A* and *B* are both positive integers, we have (A + B) > 0 and AB > 0.

If (A = 1 and B = 2), we have AB < (A + B).

If (A = 2 and B = 3), we have (A + B) < AB.

Thus, we cannot say which one of A + B and AB has the highest value.

44.
$$0 < x < 1 \Rightarrow x^2 < x < 1$$
 ...(i)
$$\Rightarrow \frac{1}{x^2} > \frac{1}{x} > 1 > x > x^2 \quad \text{[using (i)]}$$

Hence, $\frac{1}{x^2}$ is the greatest.

45.
$$p < 1 \Rightarrow \frac{1}{p} > 1 \Rightarrow \frac{2}{p} > 2 \Rightarrow \frac{2}{p} - p > 2 - p > 0 \ [\because p < 1]$$

Hence, $\left(\frac{2}{p} - p\right)$ is a positive number.

46.
$$(x^2 + x + 1) = \left(x^2 + x + \frac{1}{4}\right) + \frac{3}{4}$$

$$= \left(x + \frac{1}{2}\right)^2 + \frac{3}{4} \ge \frac{3}{4}$$

$$\left[\because \left(x + \frac{1}{2}\right)^2 \ge 0\right]$$

Hence, $(x^2 + x + 1)$ is greater than or equal to $\frac{3}{4}$.

47.
$$\left(\frac{1}{2} + \frac{1}{3} + \frac{1}{7}\right) + \frac{1}{n} = \frac{(21 + 14 + 6)}{42} + \frac{1}{n} = \left(\frac{41}{42} + \frac{1}{n}\right)$$

This sum is a natural number when n = 42. So, each one of the statements that 2 divides n; 3 divides n and 7 divides n is true.

Hence, n > 84 is false.

48.
$$\frac{(16n^2 + 7n + 6)}{n} = \left(\frac{16n^2}{n} + \frac{7n}{n} + \frac{6}{n}\right) = \left(16n + 7 + \frac{6}{n}\right).$$
For $\left(16n + 7 + \frac{6}{n}\right)$ to be an integer, we may have $n = 1$

or n = 2 or n = 3 or n = 6.

Hence, 4 values of n will give the desired result.

- **49.** $(p > q \text{ and } r < 0) \Rightarrow pr < qr \text{ is true.}$
- **50.** $(X < Z \text{ and } X < Y) \Rightarrow X^2 < YZ$.
- **51.** x + y > p and $p > z \Rightarrow x + y > z$.

52.
$$\frac{(a-b)}{3.5} = \frac{4}{7} \Rightarrow (a-b) = \frac{4}{7} \times \frac{7}{2} = 2 \Rightarrow b < a.$$

53.
$$\frac{13}{1} = \frac{13 \ w}{(1-w)} \Rightarrow \frac{w}{(1-w)} = 1 \Rightarrow w = 1 - w \Rightarrow 2w = 1 \Rightarrow w = \frac{1}{2}$$

 $\therefore (2w)^2 = 4w^2 = 4 \times \frac{1}{4} = 1.$

Questions 54 to 57

Let the digits of the number in order be A, B, C, D, E. Then, A > 5 $E \Rightarrow E = 1$.

A, *B*, *C* are all odd and none of the digits is $3 \Rightarrow A$, *B*, *C* are the digits from 5, 7, 9.

Since *A* is the largest digit, so A = 9.

. B = 5 or 7 and C = 5 or 7.

Now, the number DE is the product of two prime numbers. E = 1 and D = 2, 4, 6 or 8.

41 and 61 are prime numbers and 81 cannot be expressed as product of two primes.

Only 21 can be expressed as the product of two prime numbers ($21 = 3 \times 7$).

So, D = 2.

Hence, the number is 95721 or 97521.

- **54.** The second digit of the number is either 5 or 7.
- 55. The last digit of the number is 1.
- 56. The largest digit in the number is 9.
- 57. The number is odd. So, it is not divisible by 2 or 4. Sum of digits = 9 + 7 + 5 + 2 + 1 = 24, which is divisible by 3 but not by 9.

So, the given number is divisible by 3.

- 58. The least prime number is 2.
- **59. Statement 1.** Let x = 4 and y = 15. Then, each one of x and y is a composite number.

But, x + y = 19, which is not composite.

: Statement 1 is not true.

Statement 2. We know that 1 is neither prime nor composite.

: Statement 2 is not true.

Thus, neither 1 nor 2 is correct.

- **60.** Prime numbers between 0 and 50 are: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43 and 47. Their number is 15.
- **61.** Each of the required numbers must divide (143 3) = 140 exactly.

Now, $140 = 5 \times 7 \times 4$.

Hence, the required prime numbers are 5 and 7.

- **62.** Sum of first four prime numbers = (2 + 3 + 5 + 7) = 17.
- **63.** Sum of all prime numbers from 1 to 20 = (2 + 3 + 5 + 7 + 11 + 13 + 17 + 19) = 77.
- **64.** Clearly, 11 is a prime number which remains unchanged when its digits are interchanged. And, (11)² = 121. Hence, the square of such a number is 121.
- **65.** Let the required prime number be p. Let p when divided by 6 give n as quotient and r as remainder. Then p = 6n + r, where $0 \le r < 6$

Now, r = 0, r = 2, r = 3 and r = 4 do not give p as prime. $\therefore r \neq 0$, $r \neq 2$, $r \neq 3$ and $r \neq 4$.

Hence, r = 1 or r = 5.

- **66.** Clearly, $21 = 3 \times 7$, so 21 is not prime.
- **67.** Clearly, 19 is a prime number.

127 is a prime number.

68. We know that 115 is divisible by 5. So, it is not prime. 119 is divisible by 7. So, it is not prime. 127 < (12)² and prime numbers less than 12 are 2, 3, 5, 7, 11. Clearly, 127 is not exactly divisible by any of them. Hence,

- 69. Clearly, 143 is divisible by 11. So, 143 is not prime.
 289 is divisible by 17. So, 289 is not prime.
 117 is divisible by 3. So, 117 is not prime.
 359 < (20)² and prime numbers less than 20 are 2, 3, 5, 7, 11, 13, 17, 19.
 And, 359 is not exactly divisible by any of them. Hence, 359 is a prime number.
- **70.** Putting n = 1, 2, 3, 4 respectively in (2n + 1) we get: $(2 \times 1 + 1) = 3, (2 \times 2 + 1) = 5, (2 \times 3 + 1) = 7$ and $(2 \times 4 + 1) = 9$,

where 3, 5, 7 are prime numbers.

- \therefore The smallest value of n for which (2n + 1) is not prime, is n = 4.
- **71.** Clearly, 100 is divisible by 2. So, 100 is not prime. (101) < (11)² and prime numbers less than 11 are 2, 3, 5, 7. Clearly, 101 is not divisible by any of 2, 3, 5 and 7. Hence, 101 is the smallest 3-digit prime number.
- 72. Each one of 112, 114, 116, 118 is divisible by 2. So, none is prime.
 Each one of 111, 114, 117 is divisible by 3. So, none is prime.
 Clearly, 115 is divisible by 5. So, it is not prime.
 Each one of 112 and 119 is divisible by 7. So, none is prime.
 Hence, there is only 1 prime number between 110 and
- 120, which is 113.

 73. Let the given prime numbers be p, q, r and s. Then $p \times q \times r = 385$ and $q \times r \times s = 1001$

$$\Rightarrow \frac{p \times q \times r}{q \times r \times s} = \frac{\stackrel{39}{385}}{\stackrel{1001}{143}} = \frac{5}{13} \Rightarrow \frac{p}{s} = \frac{5}{13} \Rightarrow p = 5 \text{ and } s = 13.$$

Hence the largest of these prime numbers is 13.

- **74.** Let the required prime numbers be x, y, y + 36. Then, $x + y + y + 36 = 100 \Rightarrow x + 2y = 64$ Let x = 2. Then, $2y = 62 \Rightarrow y = 31$. So, these prime numbers are 2, 31 and 67. In given choices 67 is the answer.
- 75. $\sqrt{437} > 20$ All prime numbers less than 20 are 2, 3, 5, 7, 11, 13, 17, 19. 161 is divisible by 7, 221 is divisible by 13 and 437 is divisible by 19. 373 is not divisible by any of the above prime numbers.
- ∴ 373 is prime.76. The required arithmetic sequence of five prime numbers is 5, 11, 17, 23, 29 and therefore, the required 5th term is 29.
- 77. Each of the numbers 302, 303, 304, 305, 306, 308, 309, 310, 312, 314, 315, 316 and 318 is clearly a composite number. Out of 307, 311, 313, 317 and 319 clearly every one is prime. Hence, there are 5 prime numbers between 301 and 320.
- **78.** Clearly, $3 \neq 4n + 1$ and $3 \neq 4n + 3$ for any natural number n. \therefore Statement (1) is false. Putting p = 3, 5, 7, 11, 13, 17 etc. we get:

(p-1) $(p+1) = (2 \times 4)$, (4×6) , (6×8) , (10×12) , (12×14) , (16×18) etc., each one of which is divisible by 4.

∴ Statement (2) is true.

Hence, (1) is false and (2) is true. **79.** $n = 1 \Rightarrow (n^2 + n + 41) = (1 + 1 + 41) = 43$, which is prime. $n = 10 \Rightarrow (n^2 + n + 41) = (100 + 10 + 41) = 151$, which is prime. $n = 20 \Rightarrow (n^2 + n + 41) = (400 + 20 + 41) = 461$, which is prime. $n = 40 \Rightarrow (n^2 + n + 41) = (1600 + 40 + 41) = 1681$, which is divisible by 41.

Thus, 1681 is not a prime number.

Hence n = 40 for which $(n^2 + n + 41)$ is not prime.

80. $X_2 = (2 \times 3) + 1 = 7$, which is prime and $X_2 + 1 = 8$, which is even. $X_3 = (2 \times 3 \times 5) + 1 = 31$, which is prime and $X_3 + 1$

= 32, which is even. $X_4 = (2 \times 3 \times 5 \times 7) + 1 = 211, \text{ which is prime and } X_4 + 1 =$

1 = 212, which is even and so on. Thus Y is prime and (Y + 1) is even

Thus X_k is prime and $(X_k + 1)$ is even.

Hence, 1 and 3 are true statements.

- **81.** $6 \times 3 (3 1) = 6 \times 3(2) = 6 \times 6 = 36$.
- **82.** Given Expression = (1234 + 2345 + 4567) 3456 = (8146 3456) = 4690.

(0)	. 10	,	,	710	,0,

 1 \ 3 \ 0 \ 5 \ 6
 \end{array}$
- **90.** Let 8888 + 848 + 88 x = 7337 + 737. Then 9824 x = 8074

91. Let $414 \times x \times 7 = 127512$. Then

$$x = \frac{127512}{414 \times 7} = \frac{18216}{414} = \frac{2024}{46} = \frac{1012}{23} = 44$$

$$23)1012($$

$$\frac{92}{92}$$

$$92$$

92. 82540027 × 43253 = 82540027 × (40000 + 3000 + 200 + 50 + 3) = (82540027 × 40000) + (82540027 × 3000)+(82540027 × 200) + (82540027 × 50) + (82540027 × 3)

Shortcut Method:

Product of unit's digits of the given numbers = $7 \times 3 = 21$ Clearly, the required product will have 1 as the unit's digit, which is 3570103787831.

93. Let
$$\frac{46351 - 36418 - 4505}{x} = 1357. \text{ Then}$$
$$x = \frac{46351 - (36418 + 4505)}{1357}$$
$$\Rightarrow x = \frac{(46351 - 40923)}{1357} = \frac{5428}{1357} = 4.$$

94.
$$6 \times 66 \times 666 = 6 \times (6 \times 11) \times (6 \times 111)$$

= $(6 \times 6 \times 6) \times (11 \times 111) = (216 \times 1221)$
= $(1221 \times 216) = 1221 \times (200 + 10 + 6)$
= $(1221 \times 200) + (1221 \times 10) + (1221 \times 6)$
= $244200 + 12210 + 7326 = 263736$.

97. Given Expression = 17 + (-12) - 48 = 17 - 60 = -43.

98.
$$\frac{60840}{234} = \frac{30420}{117} = \frac{3380}{13} = 260.$$

99. Let
$$3578 + 5729 - x \times 581 = 5821$$
. Then
$$x \times 581 = (3578 + 5729) - 5821 \Rightarrow x \times 581 = (9307 - 5821)$$

$$= 3486 \Rightarrow x = \frac{3486}{581} = 6.$$
100. $-95 \div 19 = \frac{-95}{19} = -5.$

102.
$$8899 - 6644 - 3322 = x - 1122 \Rightarrow 2255 - 3322 + 1122 = x \Rightarrow x = 3377 - 3322 = 55.$$

103. Let
$$74844 \div x = 54 \times 63$$
. Then, $\frac{74844}{x} = 54 \times 63$

$$\Rightarrow x = \frac{74844}{54 \times 63} = \frac{8316}{6 \times 63} = \frac{1386}{63} = \frac{198}{9} = 22$$

104.
$$1256 \times 3892 = (1000 + 200 + 50 + 6) \times 3892$$

= $(1000 \times 3892) + (200 \times 3892) + (50 \times 3892) + (6 \times 3892)$
= $3892000 + 778400 + 194600 + 23352$
= 4888352 .

105.
$$786 \times 964 = (800 - 14) \times 964$$

= $(800 \times 964) - (14 \times 964)$
= $(771200 - 13496) = 757704$.
$$\begin{array}{r} 7 \ 7 \ 1 \ 2 \ 0 \ 0 \\ \hline -1 \ 3 \ 4 \ 9 \ 6 \\ \hline 7 \ 5 \ 7 \ 7 \ 0 \ 4 \end{array}$$

106.
$$348 \times 265 = (350 - 2) \times 265 = (350 \times 265) - (2 \times 265)$$

= $\{(300 + 50) \times 265\} - 530 = (300 \times 265)$
+ $(50 \times 265) - 530$
= $79500 + 13250 - 530 = 92750 - 530$
= 92220 .

107. $(71 \times 29 + 27 \times 15 + 8 \times 4) = (80 - 9) \times 29 + 405 + 32 = (80 \times 29) - (9 \times 29) + 437 = 2320 - 261 + 437 = 2757 - 261 = 2496.$

108. Let
$$x \times (|a| \times |b|) = -ab$$
. Then, $x = \frac{-(ab)}{|ab|} = -1$.

109. Let
$$(46)^2 - x^2 = 4398 - 3066$$

Then, $(46)^2 - x^2 = 1332 \Rightarrow x^2 = (46)^2 - 1332$
 $\therefore x^2 = (50 - 4)^2 - 1332 = (50)^2 + 4^2 - 2 \times 50 \times 4 - 1332$
 $\Rightarrow x^2 = 2500 + 16 - 400 - 1332 = 2516 - 1732 = 784$
 $\Rightarrow x = \sqrt{784} = 28$.

110.
$$(800 \div 64) \times (1296 \div 36) = \frac{50}{800} \times \frac{108}{1296} \times \frac{1296}{36} = 450.$$

111.
$$5358 \times 51 = 5358 \times (50 + 1) = 5358 \times 50 + 5358 \times 1$$

= $\frac{5358 \times 100}{2} + 5358$
= $\frac{535800}{2} + 5358 = 267900 + 5358 = 273258$.

112.
$$587 \times 999 = 587 \times (1000 - 1) = (587 \times 1000) - (587 \times 1) = 587000 - 587 = 586413.$$

113.
$$3897 \times 999 = 3897 \times (1000 - 1) = (3897 \times 1000) - (3897 \times 1) = 3897000 - 3897 = 3893103.$$

725117481

114.
$$72519 \times 9999 = 72519 \times (10000 - 1)$$

= $(72519 \times 10000) - (72519 \times 1)$
= $725190000 - 72519 = 725117481$.
 $725190000 - 72519 = 725117481$.

115.
$$2056 \times 987 = 2056 \times (1000 - 13)$$

= $(2056 \times 1000) - (2056 \times 13)$
= $2056000 - 26728 = 2029272$.

116.
$$1904 \times 1904 = (1904)^2 = (1900 + 4)^2$$

= $(1900)^2 + 4^2 + 2 \times 1900 \times 4$
= $3610000 + 16 + 15200 = 3625216$.

117.
$$1397 \times 1397 = (1397)^2 = (1400 - 3)^2$$

= $(1400)^2 + 3^2 - 2 \times 1400 \times 3 = 1960000 + 9 - 8400$
= 1951609.

118.
$$(107 \times 107) + (93 \times 93) = (107)^2 + (93)^2$$

 $= (100 + 7)^2 + (100 - 7)^2$
 $= (a + b)^2 + (a - b)^2 = 2(a^2 + b^2)$
 $= 2[(100)^2 + 7^2] = 2[10000 + 49]$
 $= 2 \times 10049 = 20098.$

119.
$$(217 \times 217) + (183 \times 183) = (217)^2 + (183)^2$$

= $(200 + 17)^2 + (200 - 17)^2 = (a + b)^2 + (a - b)^2$
= $2(a^2 + b^2)$, where $a = 200$, $b = 17$
= $2[(200)^2 + (17)^2] = 2[40000 + 289]$
= $(2 \times 40289) = 80578$.

120.
$$(106 \times 106 - 94 \times 94) = (106)^2 - (94)^2$$

= $(106 + 94) (106 - 94) = (200 \times 12) = 2400$.

121.
$$(8796 \times 223 + 8796 \times 77) = 8796 \times (223 + 77)$$

[by distributive law] $= (8796 \times 300) = 2638800.$

122.
$$(287 \times 287 + 269 \times 269 - 2 \times 287 \times 269)$$

= $(287)^2 + (269)^2 - (2 \times 287 \times 269)$
= $(287 - 269)^2 = (18)^2 = 324$.
[: $a^2 + b^2 - 2ab = (a - b)^2$]

123.
$$(476 + 424)^2 - 4 \times 476 \times 424 = (a + b)^2 - 4ab = (a - b)^2$$
, where $a = 476$ & $b = 424 = (476 - 424)^2 = (52)^2 = (50 + 2)^2$ = $(50)^2 + 2^2 + 2 \times 50 \times 2$ = $(2500 + 4 + 200) = 2704$.

$$= (30) + 2 + 2 \times 30 \times 2$$

$$= (2500 + 4 + 200) = 2704.$$
124. $(112 \times 5^4) = 112 \times \left(\frac{10}{2}\right)^4 = \frac{112 \times 10000}{16} = 70000.$

125.
$$(5746320819 \times 125) = \frac{5746320819 \times (125 \times 8)}{8}$$

= $\frac{5746320819 \times 1000}{8} = \frac{5746320819000}{8} = 718290102375.$

126.
$$935421 \times 625 = \frac{935421 \times 625 \times 16}{16} = \frac{935421 \times 10000}{16}$$
$$= \frac{9354210000}{16} = 584638125.$$

127.
$$(999)^2 - (998)^2 = (999 + 998)(999 - 998) = (1997 \times 1) = 1997$$
.

128.
$$(80)^2 - (65)^2 + 81 = (80 + 65) (80 - 65) + 81 = (145 \times 15) + 81 = (2175 + 81) = 2256.$$

129.
$$(24 + 25 + 26)^2 - (10 + 20 + 25)^2 = (75)^2 - (55)^2$$

= $(75 + 55) (75 - 55) = (130 \times 20) = 2600$.

130.
$$(65)^2 - (55)^2 = (65 + 55)(65 - 55) = (120 \times 10) = 1200.$$

131.
$$(a^2 - b^2) = 19 \Rightarrow (a + b) (a - b) = 19$$
. Clearly, $a = 10$ and $b = 9$.

132. Since $(a + b)^2 - (a - b)^2 = 4ab$, so the given expression should be a multiple of 4. So, the least value of 4ab is 32 and so the least value of

Hence, the smallest value of a is 4 and that of b is 2. Hence, a = 4.

133. Given Expression =
$$(397)^2 + (104)^2 + 2 \times 397 \times 104$$

= $(397 + 104)^2 = (501)^2 = (500 + 1)^2$
= $(500)^2 + 1^2 + 2 \times 500 \times 1 = 250000 + 1 + 1000 = 251001$.

134.
$$(64)^2 - (36)^2 = 20 \times x \Rightarrow (64 + 36) (64 - 36) = 20 \times x$$

$$\Rightarrow x = \frac{100 \times 28}{20} = 140.$$

135. Given Expression
$$= \frac{(a+b)^2 - (a-b)^2}{ab} \text{ (where } a = 489, b = 375) = \frac{4ab}{ab} = 4$$

136. Given Expression =
$$\frac{(a+b)^2 + (a-b)^2}{(a^2+b^2)}$$
, (where $a = 963$ and $b = 476$) = $\frac{2(a^2+b^2)}{(a^2+b^2)} = 2$.

(where
$$a = 963$$
 and $b = 476$) = $\frac{2(a^2 + b^2)}{(a^2 + b^2)} = 2$

$$= \frac{(a^3 + b^3)}{(a^2 - ab + b^2)}, \text{ (where } a = 768 \text{ and } b = 232) = (a + b)$$
$$= (768 + 232) = 1000.$$
$$(854)^3 - (276)^3$$

=
$$(768 + 232) = 1000$$
.
138. Given Expression = $\frac{(854)^3 - (276)^3}{(854)^2 + (854 \times 276) + (276)^2}$
= $\frac{(a^3 - b^3)}{(a^2 + ab + b^2)}$, where $a = 854$ and $b = 276$
= $(a - b) = (854 - 276) = 578$.

139. Given Expression =
$$\frac{(753)^2 + (247)^2 - (753 \times 247)}{(753)^3 + (247)^3}$$
$$= \frac{(a^2 + b^2 - ab)}{(a^3 + b^3)}, \text{ where } a = 753 \text{ and } b = 247$$
$$= \frac{1}{(a+b)} = \frac{1}{(753 + 247)} = \frac{1}{1000}.$$

140. Given Expression =
$$\frac{(256)^2 - (144)^2}{112} = \frac{(256 + 144)(256 - 144)}{112}$$
$$= \frac{(400 \times 112)}{400} = 400.$$

$$= \frac{(400 \times 112)}{112} = 400.$$
141.
$$\frac{(a^2 + b^2 + ab)}{(a^3 - b^3)} = \frac{a^2 + b^2 + ab}{(a - b)(a^2 + b^2 + ab)} = \frac{1}{(a - b)} = \frac{1}{(11 - 9)} = \frac{1}{2}.$$
142.
$$a + b + c = 0 \Rightarrow a + b = -c, (b + c) = -a \text{ and } (c + a) = -b$$
$$\Rightarrow (a + b) (b + c) (c + a) = (-c) \times (-a) \times (-b) = -(abc)$$

142.
$$a + b + c = 0 \Rightarrow a + b = -c$$
, $(b + c) = -a$ and $(c + a) = -b$ $\Rightarrow (a + b) (b + c) (c + a) = (-c) \times$

143.
$$(a^2 + b^2 + c^2 - ab - bc - ca) = (a + b + c)^2 - 3 (ab + bc + ca)$$

 $= (7 + 5 + 3)^2 - 3 (35 + 15 + 21)$
 $= (15)^2 - 3 \times 71$
 $= (225 - 213) = 12.$

144. Both addition and multiplication of numbers are commutative and associative.

145. 9*H* + *H*8 + *H*6 = 230
$$\Rightarrow$$
 {(9 × 10) + *H*} + (10*H* + 8) + (10*H* + 6) = 230 \Rightarrow 21 *H* + 104 = 230 \Rightarrow 21*H* = 126 \Rightarrow *H* = 6.

- **146.** Let the missing digit be x. Then, 1 (carried over) + 3 + x $+ x = 10 + x \Rightarrow x = 6.$
- **147**. Clearly, M = 0 since $304 \times 4 = 1216$.
- **148.** $5p9 + 327 + 2q8 = 1114 \Rightarrow (500 + 10p + 9) + (327) + (200)$ + 10q + 8) = 1114

$$\Rightarrow 10(p+q) + 1044 = 1114$$

$$\Rightarrow 10 (p+q) = 70 \Rightarrow (p+q) = 7$$

$$\Rightarrow \text{Maximum value of } q \text{ is } 7$$

[As minimum value of p = 0]

149.
$$5P7 + 8Q9 + R32 = 1928 \Rightarrow (500 + 10P + 7) + (800 + 10Q + 9) + (100R + 30 + 2) = 1928$$

$$\Rightarrow 10P + 10Q + 100R + 1348 = 1928$$

 $\Rightarrow 10(P + Q + 10R) = 580$
 $\Rightarrow P + Q + 10R = 58 \Rightarrow R = 5 \text{ and}$

P + Q = 8 or R = 4 and P + Q = 18

 \Rightarrow Maximum value of Q is 9 [for P = 9 in second case]

(3)

6x43

-46y9

1904

150. Let
$$\frac{1x \, 5y4}{148} = 78$$
.

Then,
$$10000 + 1000 x + 500 + 10y + 4 = 148 \times 78$$

 $\Rightarrow 10000 + 1000x + 500 + 10y + 4 = 11544$
 $= 10000 + 1000 + 500 + 40 + 4$
 $\Rightarrow 1000x = 1000 \Rightarrow x = 1$.

151. Let 6x43 - 46y9 = 1904.

Clearly, y = 3 and x = 5.

Hence * must be replaced by 5.

152.
$$5 P 9 - 7 Q 2 + 9 R 6 = 823$$

 $\Rightarrow (500 + 10P + 9) - (700 + 10Q + 2) + (000 + 10P +$

$$(900 + 10R + 6) = 823$$

$$\Rightarrow (500 + 900 - 700) + 10(P + R - Q) + (9 + 6 - 2) = 823$$

$$\Rightarrow$$
 700 + 10(P + R - Q) = 810 = 700 + 110

$$\Rightarrow 10 (P + R - Q) = 110$$

$$\Rightarrow P + R - Q = 11$$

$$\Rightarrow Q = (P + R - 11).$$

To get maximum value of Q we take P = 9 and R = 9. This gives Q = (9 + 9 - 11) = 7.

Hence, the maximum value of Q is 7.

153. Let the required digit be x. Then

$$x + 1x + 2x + x3 + x1 = 21x$$

$$\Rightarrow$$
 $x + 10 + x + 20 + x + 10x + 3 + 10x + 1 = 200 + 10 + x$

$$\Rightarrow$$
 22x = 210 - 34 = 176 \Rightarrow x = 8.

Hence, the required digit is 8.

154. It is given that D = 0. So, we have A = 5.

So, 1 is carried over.

$$1+B+C=10+C\Rightarrow 1+B=10\Rightarrow B=9.$$

Now, $1 + C + C = A \Rightarrow 1 + 2C = 5 \Rightarrow 2 C = 4 \Rightarrow C = 2$. Hence B = 9.

(1) CBA = 5+ C C A = 5A C 0

155. We have, C = 2.

156. Since 13b7 is divisible by 11, we have $(7+3) - (b+1) = 0 \Rightarrow 9 - b = 0 \Rightarrow b = 9.$ Putting b = 9, a + 8 = 9 we get a = 1. Hence, (a + b)=(1+9)=10.

157. Clearly, we have $ab \times b = 24$ and $ab \times a = 12$.

$$\therefore \frac{ab \times b}{ab \times a} = \frac{24}{12} \Rightarrow \frac{b}{a} = \frac{2}{1} \Rightarrow a = 1, b = 2.$$

158. Clearly, $111 \times 1 = 111 \neq 8111$.

But, $999 \times 9 = 8991$. Hence, we have 9 in place of *.

159. $(1 * 2) = 1 + 6 \times 2 = 1 + 12 = 13.$ $(1 * 2) * 3 = 13 * 3 = 13 + 6 \times 3 = 13 + 18 = 31.$

160. $8 - 7 - 6 = 8 \times 7 \times 6 - 7 \times 6 - 6$ $= (56 - 7 - 1) \times |6 = 48 \times |6 = 6 \times 8 \times |6|$

161. Highest power of 3 in 99! = $\left[\frac{99}{3}\right] + \left[\frac{99}{3^2}\right] + \left[\frac{99}{3^3}\right] + \left[\frac{99}{3^4}\right]$ $= \left\lceil \frac{99}{3} \right\rceil + \left\lceil \frac{99}{9} \right\rceil + \left\lceil \frac{99}{27} \right\rceil + \left\lceil \frac{99}{81} \right\rceil$ = 33 + 11 + 3 + 1 = 48.

Since $9 = 3^2$, so highest power of 9 dividing $99! = \frac{48}{2} = 24$.

162. Every number from 5 onwards is completely divisible \therefore (|5+|6+|7+...+|100) is completely divisible by 5.

 $(\underline{1} + \underline{12} + \underline{13} + \underline{14}) = (1 + 2 + 3 \times 2 \times 1 + 4 \times 3 \times 2 \times 1) = (1 + 2 + 6 + 24) = 33.$ Clearly, 33 when divided by 5 leaves a remainder 3. Hence, $(\underline{1} + \underline{12} + \underline{13} + \underline{14} + \underline{15} + \dots + \underline{100})$ when divided by 5 leaves a remainder 3.

163. $6^{10} \times 7^{17} \times 11^{27} = (2 \times 3)^{10} \times 7^{17} \times 11^{27} = 2^{10} \times 3^{10} \times 7^{17} \times 11^{27}$. Number of prime factors in the given expression = (10 + 10 + 17 + 27 = 64.

164. $(30)^7 \times (22)^5 \times (34)^{11} = (2 \times 3 \times 5)^7 \times (2 \times 11)^5 \times (2 \times 17)^{11}$ $= 2^{(7+5+11)} \times 3^7 \times 5^7 \times 11^5 \times 17^{11}$ $= (2^{23} \times 3^7 \times 5^7 \times 11^5 \times 17^{11}).$

Number of prime factors = (23 + 7 + 7 + 5 + 11) = 53.

- **165.** Let $x \times 48 = 173 \times 240$. Then, $x = \frac{173 \times 240}{49} = 173 \times 5 = 865$.
- **166.** $(1000 + x) > (1000 \times x)$. Clearly, x = 1.
- **167.** Let the original number be x. Then,

$$\frac{(x+7)\times 5}{9} - 3 = 12 \Rightarrow \frac{5x+35}{9} = 15 \Rightarrow 5x+35 = 135$$

 $\Rightarrow 5x = 100 \Rightarrow x = 20.$

168. 38950 is completely divisible by 410 only. Hence ₹ 410 is the correct answer.

169. Let the four consecutive even numbers be a, a + 2, a + 4and a + 6.

Then, $a + a + 2 + a + 4 + a + 6 = 180 \Rightarrow 4a = 168$ $\Rightarrow a = 42$

So, these numbers are 42, 44, 46 and 48.

Sum of next four consecutive even numbers = (50 + 52)+54+56) = 212.

170. Number on thumbs = 1, 9, 17, 25, This is an AP in which a = 1 and d = (9 - 1) = 8.

$$\begin{array}{ll} \therefore & T_n = a + (n-1)d = 1 + 8(n-1) = (8n-7). \\ 8n-7 = 1994 \Rightarrow 8n = 2001 \Rightarrow n = 250. \\ T_{250} = 1 + (250-1) \times 8 = 1 + 249 \times 8 = 1993. \\ \text{So, 1993 lies on thumb and 1994 on index finger.} \end{array}$$

171. Out of four consecutive integers two are even and therefore, their product is even and on adding 1 to it, we get an odd integer. So, n is odd. Some possible values of n are

$$n = 1 + (1 \times 2 \times 3 \times 4) = (1 + 24) = 25 = 5^2,$$

 $n = 1 + (2 \times 3 \times 4 \times 5) = (1 + 120) = 121 = (11)^2,$
 $n = 1 + (3 \times 4 \times 5 \times 6) = (1 + 360) = 361 = (19)^2,$
 $n = 1 + (4 \times 5 \times 6 \times 7) = 841 = (29)^2$ and so on.

Hence, n is odd and a perfect square.

172.
$$(x^2 + y^2) = (x + y)^2 - 2xy = (15)^2 - 2 \times 56$$

= $(225 - 112) = 113$.

173.
$$(2^2 + 4^2 + 6^2 + \dots + 40^2) = (1 \times 2)^2 + (2 \times 2)^2 + (2 \times 3)^2 + \dots + (2 \times 20)^2 = 2^2 \times (1^2 + 2^2 + 3^2 + \dots + 20^2) = (4 \times 2870) = 11480.$$

174.
$$5^2 + 6^2 + \dots + 10^2 + 20^2 = (1^2 + 2^2 + 3^2 + \dots + 10^2) - (1^2 + 2^2 + 3^2 + 4^2) + 400$$

= $\frac{1}{6}n(n+1)(2n+1) - (1+4+9+16) + 400$, where $n = 10$
= $\left(\frac{1}{6} \times 10 \times 11 \times 21\right) - 30 + 400 = (385 - 30 + 400) = 755$.

175.
$$(6 + 12 + 18 + 24 + \dots + 60) = 6 \times (1 + 2 + 3 + 4 + \dots + 10) = 6 \times 55 = 330.$$

176.
$$2^{m'} > 960$$
 when the least value of m is 10. Then, $2^{10} = 1024$ and $1024 - 960 = 64 = 2^6$. $m = 10$ and $n = 6$.

177. We keep on dividing 33333... by 7 till we get 0 as remainder.

∴ Required number = 47619

178. We keep on dividing 99999.... by 7 till we get 0 as remainder.

∴ Required number = 142857. Number of digits = 6.

Clearly, 7261 must be replaced by 2961, which is possibvle if 6648 is replaced by 6218, which in turn is possible if 5599 is replaced by 5556.

39

Thus, the correct number is 555681.

180. Clearly, multiples of 2 and 5 together yield 0. Since the product of odd numbers contains no power

of 2, so the given product does not give 0 at the unit place.

181. Let
$$N = 1 \times 2 \times 3 \times 4 \times 1000 = 1000!$$
 Clearly, the highest power of 2 in N is very high as

compared to that of 5. So, the number of zeros in *N* will be equal to the highest

power of 5 in N. .. Required number of zeros

$$= \left[\frac{1000}{5}\right] + \left[\frac{1000}{5^2}\right] + \left[\frac{1000}{5^3}\right] + \left[\frac{1000}{5^4}\right]$$
$$= 200 + 40 + 8 + 1 = 249.$$

182. Let $N = 10 \times 20 \times 30 \times \dots \times 1000 = 10^{100} \times (1 \times 2 \times 3)$ \times 4 \times 100) = $10^{100} \times$ 100!

Number of zeros in 100! = Highest power of 5 in 100! $\left[\frac{100}{5}\right] + \left[\frac{100}{5^2}\right] = 20 + 4 = 24.$

$$\therefore$$
 Number of zeros in $N = 100 + 24 = 124$.

183. Let $N = 5 \times 10 \times 15 \times 20 \times 25 \times 30 \times 35 \times 40 \times 45 \times 50$ $=5^{10}\times (1\times 2\times 3\times 4\times\times 10)=5^{10}\times 10!$

Highest power of 2 in 10! =
$$\left[\frac{10}{2}\right] + \left[\frac{10}{2^2}\right] + \left[\frac{10}{2^3}\right] = 5 + 2 + 1 = 8.$$

Highest power of 5 in $10! = \left\lceil \frac{10}{5} \right\rceil = 2$. $\therefore N = 2^8 \times 5^{12} \times k.$

Since highest power of 2 is less than that of 5, so required number of zeros = 8.

184. Clearly, highest power of 2 is much higher as compared to that of 5 in 60!, so

Required number of zeros = Highest power of

$$5 = \left[\frac{60}{5}\right] + \left[\frac{60}{5^2}\right] = 12 + 2 = 14.$$

185. Let $N = (1 \times 3 \times 5 \times 7 \times \times 99) \times 128$.

Clearly, N contains 10 multiples of 5 (5, 15, 25, 35,, 95) and only one multiple of 2 i.e. 128 or 2^7 .

Clearly, highest power of 5 in N is greater than that of 2. \therefore Number of zeros in N = Highest power of 2 in N = 7.

186. $N = 2 \times 4 \times 6 \times 8 \times \dots \times 98 \times 100$ $= 2^{50} \times (1 \times 2 \times 3 \times \dots \times 49 \times 50) = 2^{50} \times 50!$

Clearly, the highest power of 2 in *N* is much higher than that of 5.

 \therefore Number of zeros in N = Highest power of 5 in N =50] [50] =10+2=12.5

187. Clearly, the list of prime numbers from 2 to 99 has only 1 multiple of 2 and only 1 multiple of 5. So, number of zeros in the product = 1.

188. Let $N = 3 \times 6 \times 9 \times 12 \times ... \times 102 = 3^{34} \times (1 \times 2 \times 3 \times 4 \times ... \times 34) = 3^{34} \times 34!$ Clearly, highest power of 2 in 34! is much greater than that of 5. So, number of zeros in $N = \text{Highest power of 5 in 34!} = \left[\frac{34}{5}\right] + \left[\frac{34}{5^2}\right] = 6 + 1 = 7.$

189. 3^4 gives unit digit 1. So, $(3^4)^{500}$ gives unit digit 1. And, 3^3 gives unit digit 7.

 $\therefore \quad (13)^{2003} \text{ gives unit digit} = (1 \times 7) = 7.$

190. 3^4 gives unit digit 1. So, $(3^4)^{24}$ gives unit digit 1. And, 3^3 gives unit digit 7.

 \therefore 3⁹⁹ = (3⁴)²⁴ × 3³ gives unit digit (1 × 7) i.e. 7.

191. (*A*) 7^4 gives unit digit 1. So, $7^{16} = (7^4)^4$ gives unit digit 1. \therefore (1827)¹⁶ gives unit digit 1. So, $A \to (1)$.

(B) 3^4 gives unit digit 1. So, $(3^4)^4$ gives unit digit 1.

 \therefore 3¹⁹ = 3¹⁶ × 3³ gives unit digit = (1 × 7) = 7.

 \therefore (2153)¹⁹ gives unit digit 7. So, $B \rightarrow (4)$.

(C) 9^2 gives unit digit 1. So, $(9^2)^{10}$ gives unit digit 1.

 $\therefore 9^{21} = (9^{20} \times 9)$ gives unit digit = $(1 \times 9) = 9$.

 \therefore (5129)²¹ gives unit digit = 9. So, $C \rightarrow$ (5).

Hence, A B C is the correct result. 1 4 5

192. Unit digit of $(67)^{25} = \text{Unit digit of } 7^{25}$. Unit digit of 7^4 is 1 and so the unit digit of $(7^4)^6$ is 1. \therefore Unit digit of $7^{25} = (1 \times 7) = 7$. Hence, the unit digit of $(7^{25} - 1)$ is (7 - 1) = 6.

193. Unit digit in the given product = Unit digit of $(4 \times 8 \times 7 \times 3)$, which is 2.

194. Unit digit in the given product = 8. Unit digit of $(9 \times 6 \times x \times 4)$ is 8. So, x = 3.

195. Unit digit of 7^4 is 1. So, the unit digit of $(7^4)^{23}$ is 1. ∴ Unit digit of 7^{95} = Unit digit of $(7^{92} \times 7^3) = (1 \times 3) = 3$. Unit digit of 3^4 is 1. So, the unit digit of $(3^4)^{14}$ is 1. ∴ Unit digit of 3^{58} = Unit digit of $(3^{56} \times 3^2) = (1 \times 9) = 9$. Hence, the unit digit of $(7^{95} - 3^{58}) = (13 - 9) = 4$.

196. Unit digit of 4^2 is 6. So, unit digit in $(4^2)^{63}$ is 6. \therefore Unit digit of $(784)^{126}$ = Unit digit in 4^{126} , which is 6. Unit digit in 4^{127} = Unit digit in $(4^{126} \times 4)$ = Unit digit in (6×4) , which is 4. \therefore Unit digit in $(784)^{127}$ is 4.

Hence, unit digit of $\{(784)^{126} + (784)^{127}\}\ =$ Unit digit of (6 + 4) = Unit digit of 10, which is 0.

197. Unit digit in $[(251)^{98} + (21)^{29} - (106)^{100} + (705)^{35} - (16)^4 + 259] =$ Unit digit in (1 + 1 - 6 + 5 - 6 + 9) = 4.

198. Unit digit in the given product

= Unit digit in $(4^{1793} \times 5^{317} \times 1^{491})$ Unit digit in 4^2 is 6 and so the unit digit in $(4^2)^{896}$ is 6. \therefore Unit digit of 4^{1793} = Unit digit in (6×4) = Unit digit in 24, which is 4.

Unit digit in 5^{317} is 5 and the unit digit in 1^{491} is 1. \therefore Unit digit in the given product = Unit digit in (4 × 5 × 1), which is 0.

199. Let x = 2y. Then, $x^{4n} = (2y)^{4n} = \{(2y)^4\}^n = (16 \ y^4)^n$. y = 1, 2, 3, 4, 5, 6, 7, 8, 9 gives unit digit as 6 in $(16y^4)^n$. But, y = 5, gives unit digit 0 in $(16 \ y^4)^n$. Hence, the unit digit is 0 or 6.

200. In 5^n we have 5 as unit digit and in 6^m we have 6 as unit digit.

.. Unit digit in $(5^n + 6^m)$ = Unit digit in (5 + 6) = Unit digit in 11 = 1.

201. We have: $(2^{12n} - 6^{4n}) = (2^{12n} - 2^{4n} \times 3^{4n}) = 2^{4n} (2^{8n} - 3^{4n})$. Putting n = 1, we get the number $2^4 (2^8 - 3^4) = 16 (2^6 - 8^1) = (16 \times 17^5) = 2^800$ Hence, the number formed by last two digits is 00.

202. $\left(\frac{1}{5}\right)^{2000} = (0.2)^{2000}$.

Last digit of $(0.2)^{2000}$ = Last digit of $(0.2)^4$ = 6.

203. Sum of digits in the two numbers = 19 + 15 = 34. So, the product will have 33 or 34 digits. Since $36 \times 34 = 1224$ (i.e. product has 2 + 2 = 4 digits), so the number of digits in x is 34.

204. We know that a number having x,y,z as its digits, is a multiple of 11, if z + x - y = 0Hence, y = z + x.

205. 6135*n*2 is divisible by 9 if (6 + 1 + 3 + 5 + n + 2) = (17 + n) is divisible by 9.

This happens when the least value of n is 1.

206. In 978626, we have (6 + 6 + 7) - (2 + 8 + 9) = 0. Hence, 978626 is completely divisible by 11.

207. Sum of all digits = 12, which is divisible by 3. So, the given number is divisible by 3.

(Sum of digits at odd places) – (Sum of digits at even places) = 6 - 6 = 0.

So, the given number is divisible by 11.

The given number when divided by 37 gives 3003003003. So, the given number is divisible by 37.

The given number when divided by 111 gives 1001001001. Clearly, it is divisible by 111 as well as by 1001.

Hence, the given number is divisible by each one of 3, 11, 37, 111 and 1001.

208. We have $18 = 2 \times 9$, where 2 and 9 are co-primes. But, 65043 is not divisible by 2. So, it is not divisible by 18.

209. Let the missing digit be x. Then, (80 + x) must be divisible by 4. Hence, x = 4.

210. Sum of the digits in 4006020 is 12, which is divisible by 3. Hence, 4006020 is divisible by 3.

211. Clearly, (*d*) is true.

212. For 4823718 we have

(8 + 7 + 2 + 4) - (1 + 3 + 8) = (21 - 12) = 9, which is not a multiple of 11.

∴ 4823718 is not divisible by 11.

Consider the number 4832718.

We have (8 + 7 + 3 + 4) - (1 + 2 + 8) = (22 - 11) = 11, which is a multiple of 11.

Hence, 4832718 is divisible by 11.

213. Consider the number 17325.

Its unit digit is 5. So, it is divisible by 5. Sum of its digits = (5 + 2 + 3 + 7 + 1) = 18, which is divisible by 3.

So, the given number is divisible by 3.

And, since 5 and 3 are co-primes, so the given number is divisible by (5×3) , i.e. 15.

214. Given number is 7386038.

Sum of its digits = 35, which is not divisible by any of 3 and 9.

So, the given number is not divisible by any of 3 and 9. Also, 38 is not divisible by 4. So, the given number is not divisible by 4.

```
Also, (8 + 0 + 8 + 7) - (3 + 6 + 3) = (23 - 12) = 11.
So, the given number is divisible by 11.
```

215. (2 + 4 + 9 + 8 + 4) = 27, (2 + 6 + 7 + 8 + 4) = 27 and (2 + 4 + 9 + 8 + 4) = 27+8+5+8+4)=27.

So, each one is divisible by 3 and 9 both. Also, 84 is divisible by 4. So, each one is divisible by 4. Hence, each given number is divisible by 3, 9 and 4. So, the statements 1, 2 and 3 are all correct.

- 216. We know that 872 is divisible by 8. Hence 923872 is divisible by 8.
- **217.** Here (5 + 9 + x + 7) (4 + 3 + 8) = 6 + x. So, we must have x = 5.
- **218.** Take m = 15 and n = 20. Then, each one of m and n is divisible by 5. But, (m + n) is not divisible by 10. Hence, (m + n) is divisible by 10 is not true.
- 219. An integer is divisible by 16, if the number formed by last 4 digits is divisible by 16.
- 220. Clearly, 639 is not divisible by 7. Consider 2079. Sum of its digits = (2 + 0 + 7 + 9) = 18. So, it is divisible by both 3 and 9. Also, (79 - 2) = 77, which is divisible by 7.

So, 2079 is divisible by 7.

Also, (9 + 0) - (7 + 2) = 0. So, 2079 is divisible by 11. Hence, 2079 is divisible by each one of 3, 7, 9 and 11.

221. Let the given number be 476xy0. Then $(0+x+7)-(y+6+4)=0 \Rightarrow x-y-3=0 \Rightarrow x-y=3.$ Also, (4 + 7 + 6 + x + y + 0) = (17 + x + y) must be divisible by 3.

Since $x \neq 0$, $y \neq 0$, so $x + y \neq 1$. $\therefore x + y = 4 \text{ or } 7 \text{ or } 10 \text{ etc.}$

 $(x + y = 4 \text{ and } x - y = 3) \Rightarrow x = 7/2$, which is not admissible. $(x + y = 7 \text{ and } x - y = 3) \Rightarrow x = 5 \text{ and } y = 2.$

- 222. Sum of the digits in respective numbers is: 9, 12, 18, 9, 21, 12, 18, 21, 15 and 24. Out of these 12, 21, 12, 21, 15, 24 are divisible by 3 but not by 9.
- So, the number of required numbers is 6. **223.** Let the unit's place be x and the thousand's place be y. Then, 357y25x is divisible by 5 only when x = 0 or x = 5. Also, this number is divisible by 3 only when sum of its digits is divisible by 3.

So, (22 + x + y) must be divisible by 3. $\therefore x + y = 2$

Taking x = 0, we get y = 2.

So, the unit place = 0 and thousand's place = 2.

224. Clearly, (7 + 8) - (9 + 6) = 0. So, 6897 is divisible by 11. Also, $\frac{6897}{19} = 363$. So, 6897 is divisible by 19.

Hence, 6897 is divisible by both 11 and 19.

225. We have $24 = 3 \times 8$, where 3 and 8 are co-primes. Clearly, 718 is not divisible by 8. So, 35718 is not divisible

810 is not divisible by 8. So, 63810 is not divisible by 8. 804 is not divisible by 8. So, 537804 is not divisible by 8. 736 is divisible by 8. So, 3125736 is divisible by 8. Also, sum of its digits = (3 + 1 + 2 + 5 + 7 + 3 + 6) = 27, which is divisible by 3.

So, 3125736 is divisible by 3 also.

Hence, it is divisible by 24.

226. Sum of the digits of the given number = $(7 \times 3) + (14 \times 10^{-2})$ 1) = (21 + 14) = 35, which is not divisible by 3. So the given number is not divisible by 3.

1 + 3 + 1 + 1 + 3 + 1 + 1 + 3 + 1 = (19 - 16) = 3, which is neither 0 nor divisible by 11.

So, the given number is not divisible by 11 also. Hence, it is divisible by neither 3 nor 11.

227. (325 - 325) = 0, which is divisible by 7. So, the given number is divisible by 7. (5 + 3 + 2) - (2 + 5 + 3) = 0. So, the given number is divisible by 11.

And, $\frac{325325}{13}$ = 25025. So, 325325 is divisible by 13.

Hence, it is divisible by all 7, 11 and 13.

- 228. We first divide the number into groups of 3 digits from the right \rightarrow 3 0X0 103 Difference of sum of numbers at odd and even places = (103 + 3) - 0X0 = 106 - 0X0, which must be divisible by 13. 106 - 0X0 is divisible by 13 only for X = 8.
- 229. We know that 11 and 13 are co-prime. So, a number divisible by both 11 and 13 will be divisible by (11×13) .
- 230. I. We have(195 - 195) 0 ∴ 195195 is divisible by 7.
 - II. We have (181 181) = 0∴ 181181 is divisible by 7.
 - III. We have (120 120) = 0: 120120 is divisible by 7.
 - IV. We have (891 891) = 0

∴ 891891 is divisible by 7.

Hence, all are divisible by 7.

- **231.** Since 653xy is divisible by 80, we must have y = 0. Now, 653x0 must be divisible by both 5 and 16. Clearly, it is divisible by 5 for all values of x. Now, the number 53x0 must be divisible by 16. The least value of x is clearly 6. So, x + y = 6 + 0 = 6.
- **232.** We know that $33 = 11 \times 3$, where 11 and 3 are co-primes. So, the given number must be divisible by both 11 and 3. Since 5ABB7A is divisible by 11, we have (A + B + A) - (7 + B + 5) = (2A - 12) is either 0 or 11.

$$\Rightarrow 2A - 12 = 0 \text{ or } 2A - 12 = 11 \Rightarrow A = 6 \left[\because A \neq \frac{23}{2} \right]$$
So the number becomes 56 PP76, which is divisible by

So, the number becomes 56BB76, which is divisible by 3. \therefore (5 + 6 + B + B + 7 + 6) = (24 + 2B) must be divisible by 3.

$$\therefore 2B = 6 \Rightarrow B = 3 \qquad \qquad \left[\because B \neq 0 \text{ and } B \neq \frac{3}{2} \right]$$

Hence, (A + B) = (6 + 3) = 9.

233. We have, $99 = (11 \times 9)$, where 11 and 9 are co-primes. Consider the number 114345.

Clearly, (5 + 3 + 1) - (4 + 4 + 1) = 0. So, 114345 is divisible by 11.

Also, sum of its digits = (1 + 1 + 4 + 3 + 4 + 5) = 18, which is divisible by 9.

 \therefore 114345 is divisible by 9.

Hence, it is divisible by (11×9) , i.e. 99.

234. Let the unit's digit be x and ten's digit be y. Then, the number is 3422213yx.

Also, $99 = (11 \times 9)$, where 11 and 9 are co-primes. Since the given number is divisible by 9, it follows that (3 + 4 + 2 + 2 + 2 + 1 + 3 + y + x) = (17 + y + x) must be divisible by 9.

So,
$$y + x = 1$$
 or $y + x = 10$.

Again, the given number is divisible by 11.

So,
$$(x + 3 + 2 + 2 + 3) - (y + 1 + 2 + 4) = x - y + 3$$
 is either 0 or 11.

$$(x - y + 3 = 0 \text{ or } x - y + 3 = 11) \Rightarrow (y - x = 3 \text{ or } x - y = 8)$$

Now,
$$(y + x = 1 \text{ and } y - x = 3) \Rightarrow y = 2 \text{ and } x = -1.$$

$$(y + x = 1 \text{ and } x - y = 8) \Rightarrow x = \frac{9}{2}$$

$$(y + x = 10 \text{ and } y - x = 3) \Rightarrow y = \frac{13}{2}$$

$$(y + x = 10 \text{ and } x - y = 8) \Rightarrow x = 9 \text{ and } y = 1.$$

Thus, x = 9, y = 1. So, the required number is 342221319.

235. 37×3 is divisible by 7

 \Rightarrow (7 × 3 – 3) is either 0 or divisible by 7)

 \Rightarrow 7 × 0 is divisible by 7.

 \Rightarrow X = 0 or X = 7.

236. $225 = 9 \times 25$, where 9 and 25 are co-primes.

So, a number is divisible by 225 if it is divisible by both

Given number is divisible by 25, only if 7q is divisible by 25, i.e. if q = 5.

Sum of digits of given number = (8 + 7 + 6 + p + 3 + 7 + 5) =36 + p, which must be divisible by 9.

This is possible if p = 0.

Hence, p = 0, q = 5.

237. Since 774958*A*96*B* is divisible by 8, so the number 96*B* must be divisible by 8. So, B = 0, as 960 is divisible by 8. Now, 774958A960 is divisible by 9. So, (55 + A) must be divisible by 9.

This happens when A = 8. Hence, A = 8 and B = 0.

238. $132 = 11 \times 3 \times 4$. So, the required number must be divisible by 3, 4 and 11.

 $264 \rightarrow$ divisible by 3, 4 and 11.

 $396 \rightarrow \text{divisible by } 3, 4 \text{ and } 11.$

 $462 \rightarrow \text{not divisible by 4}$.

 $792 \rightarrow$ divisible by 3, 4 and 11.

 $968 \rightarrow \text{not divisible by } 3$

 $2178 \rightarrow \text{not divisible by } 4$

 $5184 \rightarrow \text{not divisible by } 11.$

 $6336 \rightarrow \text{divisible by } 3, 4 \text{ and } 11.$

Hence, out of the given numbers 4 are divisible by 3, 4

239. Let 3x + 7y = 11k. Then, $y = \frac{(11k - 3x)}{7}$. Then, $5x - 3y = 5x - \frac{3(11k - 3x)}{7} = \frac{35x - 33k + 9x}{7}$

Then,
$$5x - 3y = 5x - \frac{3(11k - 3x)}{7} = \frac{35x - 33k + 9x}{7}$$

$$=\frac{44x-33k}{7}=\frac{11(4x-3k)}{7}$$
, which is divisible by 11.

- **240.** $(1^3 1) = 0$, $(2^3 2) = 6$, $(3^3 3) = 24$, $(4^3 4) = 60$ and so on, each one of which is divisible by 6.
- **241.** Let a = 2k + 1 & b = 2m + 1. Then, $a^4 - b^4 = (a^2 - b^2)(a^2 + b^2) = (a + b)(a - b)(a^2 + b^2)$ $= (2k + 2m + 2) (2k - 2m) (4k^2 + 4m^2 + 2 + 4k + 4m)$ $= 8(k + m + 1) (k - m) (2k^2 + 2m^2 + 1 + 2k + 2m),$ which is divisible by 8.
- **242.** Let the two consecutive integers be a and (a + 1). Then, $(a + 1)^2 - a^2 = a^2 + 1 + 2a - a^2 = (2a + 1) = (a + a + 1) =$ sum of given integers.

- **243.** $6n^2 + 6n = 6n (n + 1)$ $(n = 1 \Rightarrow 6n^2 + 6n = 12), (n = 2 \Rightarrow 6n^2 + 6n = 36), (n = 3)$ \Rightarrow 6 n^2 + 6n = 72), each one of which is divisible by 6 and 12 both.
- **244.** Let the ten's digit be x and the unit's digit be y. Then, (10x)(x + y) - (10y + x) = 9x - 9y = 9(x - y), which is divisible by 9.
- **245.** Let the ten's digit be x and the unit's digit be y. Then, (10x + y) + (10y + x) = 11(x + y), which is divisible by 11.
- **246.** Let P = n (n + 1) (n + 2) (n + 3). Then, n = 1 gives $P = (1 \times 2 \times 3 \times 4) = 24.$

Hence, the required number is 24.

- **247**. Let $N = n^2 (n^2 1) = n^2 (n 1) (n + 1)$. Then, $n = 2 \Rightarrow N = 2^2 \times (2 - 1) \times (2 + 1) = (4 \times 1 \times 3) = 12$. Hence, the required number is 12.
- **248.** Let n = (2m + 1). Then,

 $N = n(n^2 - 1) = n (n - 1) (n + 1) = (2m + 1) (2m) (2m + 2)$ =4m (m + 1) (2m + 1).

Now, $m=1 \Rightarrow N=(4\times 1\times 2\times 3)=24$.

So, N is always divisible by 24.

249. Let the hundreds, tens and unit digits be x, y and zrespectively.

Then, (100x + 10y + z) - (x + y + z) = 99x + 9y = 9 (11x)

So, the resulting number is divisible by 9.

250. Let the required number be x. Then $\frac{11x+11}{13}$ = a whole

So, (11x + 11) must be divisible by 13. By hit and trial, we get x = 12.

Hence, the smallest original number is 12.

251. Let the required product be n (n + 1) (n + 2). Then,

 $n = 1 \Rightarrow n (n + 1) (n + 2) = (1 \times 2 \times 3) = 6.$

 $n = 2 \Rightarrow n (n + 1) (n + 2) = (2 \times 3 \times 4) = 24.$

 $n = 3 \Rightarrow n (n + 1) (n + 2) = (3 \times 4 \times 5) = 60.$

So, each such product is divisible by 6.

252. Let the required odd numbers be n, (n + 2) and (n + 4). Then n + (n + 2) + (n + 4) = 3n + 6 = 3(n + 2), which is always divisible by 3.

But $n = 1 \Rightarrow 3(n + 2) = 3 \times 3 = 9$ which is not divisible by any of 2, 5 and 6.

Hence only II is true.

253. Three consecutive multiples of 3 are 3m, 3(m + 1) and 3(m + 2).

Their product = $3m \times 3(m + 1) \times 3(m + 2) = 27 \times m \times (m \times 2)$ $+ 1) \times (m + 2).$

Putting m = 1, this product is $(27 \times 1 \times 2 \times 3) = 162$. So, this product is always divisible by 162.

- **254.** $p = 5 \Rightarrow (p^2 1) = (25 1) = 24$, which is divisible by 24. $p = 7 \Rightarrow (p^2 - 1) = (49 - 1) = 48$, which is divisible by 24. $p = 11 \Rightarrow (p^2 - 1) = (121 - 1) = 120$, which is divisible by 24. Hence, $(p^2 - 1)$ is always divisible by 24.
- 255. Let the two consecutive odd integers be (2m + 1) and

Then, $(2m + 3)^2 - (2m + 1)^2 = [(2m + 3) + (2m + 1)][(2m + 3)^2 + (2m + 1)]$ $[+3) - (2m + 1)] = (4m + 4) \times 2 = 8m + 8 = 8(m + 1)$, which is always divisible by 8.

256. Clearly, 2525 is not divisible by any of the numbers 7, 11 and 13.

The smallest 3-digit prime number is 101.

0 1		
25	32	
101)2525 (101)3232 (
202	303 `	
505	202	
<u>505</u>	<u>202</u>	
<u>×</u>	<u> </u>	

Hence (d) is true.

- 257. Numbers like 2525, 3636 etc. are divisible by 101. Numbers like 256256, 678678 etc. are divisible by 1001. Numbers like 32163216, 43754375 etc. are divisible by 10001 and so on.
- **258.** 10^n has (n + 1) digits. Then, 9 will appear *n* times in $(10^n 1)$. So, sum of digits in $(10^n - 1) = 9n$.

$$9n = 4707 \Rightarrow n = \frac{4707}{9} = 523$$

- $\therefore 9n = 4707 \Rightarrow n = \frac{4707}{9} = 523.$ **259.** We know that $(x^n a^n)$ is always divisible by (x a) for all values of n.
- **260.** The product of 8 consecutive numbers is divisible by each one of 8!, 7!, 6!, 5!, 4!, 3! and 2!
- **261.** We know that $(x^n a^n)$ is divisible by (x a), when n is even and $(x^n - a^n)$ is divisible by (x + a), when n is even. \therefore (10ⁿ – 1) is divisible by (10 – 1) = 9, when *n* is even. And, $(10^n - 1)$ is divisible by (10 + 1) = 11, when *n* is even. : Statements 2 and 4 are correct.
- **262.** Putting n = 1, we get $(3^{4n} 4^{3n}) = (3^4 4^3) = (81 64) = 17$, which is divisible by 17.
- **263.** Let the odd natural number be (2n + 1). n = 1 gives $(2n + 1)^2 = (2 + 1)^2 = 9$.

This when divided by 8 gives 1 as remainder.

n = 2 gives $(2n + 1)^2 = 25$. This when divided by 8 gives 1 as remainder and so on.

- **264.** Required number = $(2^5 2) = (32 2) = 30$. **265.** Two consecutive even integers are 2n and (2n + 2). $(2n + 2)^2 - (2n)^2 = (4n^2 + 4 + 8n - 4n^2) = 4 + 8n = 4(1 + 4n^2)$
- 2n), which is always divisible by 4. **266.** Two consecutive odd integers are (2m + 1) and (2m + 3).
- $\therefore (2m+3)^2 (2m+1)^2 = (2m+3+2m+1)(2m+1)$ 3 - 2m - 1) = $(4m + 4) \times 2 = 8(m + 1)$, which is always divisible by 8.
- 267. The smallest 4-digit number is 1000.

This when divided by 7 leaves 6 as remainder.

:. 1001 is the smallest 4-digit number exactly divisible by 7.

- 268. On dividing 1056 by 23, we get 21 as remainder.
 - \therefore Required number to be added = (23 21) = 2.

23) 1056(45

274. On dividing 58701 by 567, we get 300 as remainder. \therefore Required number = 58701 + (567 - 300) = 58701 + 267

275. On dividing 8112 by 99, we get 93 as remainder. So, the required number to be subtracted is 93.

iniber to be a	•
99)8112(81	
792	
192	
99	
93	

- 276. On dividing 803642 by 11, we get 4 as remainder. Required number to be added = (11 - 4) = 7.
- 277. On dividing 1111 by 99, the quotient is 11 and the remainder is 22.

Hence, the required number is 11

1001 15 11.		
99)1111(11		
99		
121		
99		
22		

278. $66 = 11 \times 6$

In order to get a number divisible by 18, the above product must be multiplied by 3.

Hence 66 must be multiplied by 3.

279. The smallest 6-digit number is 100000. On dividing 100000 by 111, we get 100 as remainder.

So, the number to be added = (111 - 100) = 11. Hence, the required number = 100011.

280. All 2-digit numbers divisible by 5 are 10, 15, 20, 25,, 95.

This is an *A.P.* in which a = 10, d = 5 and $T_n = 95$. $T_n = 95 \Rightarrow a + (n - 1) d = 95 \Rightarrow 10 + (n - 1) \times 5 = 95$

$$\Rightarrow (n-1) = \frac{85}{5} = 17 \Rightarrow n = 18.$$

:. Sum =
$$\frac{n}{2}(a+l) = \frac{18}{2}(10+95) = (9\times105) = 945$$
.

- **281.** 3-digit numbers divisible by 6 are 102, 108, 114,, 996. This is an A.P. in which a = 102, d = 6 and $T_n = 996$.
 - \therefore $T_n = a + (n-1)$ $d \Rightarrow 102 + (n-1) \times 6 = 996 \Rightarrow (n-1) \times 6 = 894$

$$\Rightarrow$$
 $(n-1) = 149 \Rightarrow n = 150$.

Hence, there are 150 such numbers.

282. Multiples of 7 between 11 and 200 are 14, 21, 28, 35, 42,, 189, 196.

$$T_m=196\Rightarrow 14+(m-1)\times 7=196\Rightarrow (m-1)\times 7=182 \Rightarrow (m-1)=26\Rightarrow m=27.$$

Multiples of 7 and 3 both, i.e. that of 21 are 21, 42, 63,, 189

$$\begin{array}{l} T_n=189 \Rightarrow 21+(n-1)\times 21=189 \Rightarrow (n-1)\times 21=168 \\ \Rightarrow (n-1)=8 \Rightarrow n=9. \end{array}$$

- \therefore Required number of terms = (27 9) = 18.
- **283.** Numbers between 14 and 95 and divisible by 3 are 15, 18, 21 24,, 93.

$$T_m = 93 \Rightarrow 15 + (n-1) \times 3 = 93 \Rightarrow (n-1) \times 3 = 78$$

 $\Rightarrow (n-1) = 26 \Rightarrow n = 27.$

Numbers to be deleted are 33, 63, 93.

They are 3 in number.

Required number of numbers = (27 - 3) = 24.

- **284.** Required numbers are multiples of (10×13) , i.e. 130. These numbers are 130, 260, 390, 520, 650, 780 and 910. They are 7 in number.
- **285.** Number of integers between 100 and 150 (including both) = 51.

Numbers divisible by 3 are 102, 105, 108,, 150.

Let
$$T_m = 150$$
. Then, $a + (m - 1) d = T_m$.

$$\therefore 102 + (m-1) \times 3 = 150 \Rightarrow (m-1) \times 3 = 48 \Rightarrow m-1$$
$$= 16 \Rightarrow m = 17.$$

Numbers divisible by 5 are 100, 105, 110, 115,, 150. Let $T_n = 150$. Then, $a + (n - 1) d = T_n$.

$$\therefore 100 + (n-1) \times 5 = 150 \Rightarrow (n-1) \times 5 = 50 \Rightarrow (n-1)$$
$$= 10 \Rightarrow n = 11.$$

Numbers divisible by both 3 and 5 are 105, 120, 135, 150. They are four in number.

Number of numbers divisible by 3 or 5 = (17 + 11 - 4) = 24. Number of numbers neither divisible by 3 nor by 5 are (51 - 24) = 27.

286. Numbers from 501 to 599 which have 6 as digit are 506, 516, 526, 536, 546, 556, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 576, 586 and 596, i.e. 6 occurs 20 times.

Number of times 6 occurs from 600 to 699 = 100 + 20 = 120.

- \therefore Total number of times 6 occurs = 20 + 120 = 140.
- **287.** Such numbers are 202, 212, 222, 232, 242, 252, 262, 272, 282, 292. There are 10 such numbers.

- **288.** Such numbers are 203, 213, 223, 233, 243, 253, 263, 273, 283, 293 and all numbers from 300 to 399. Clearly, number of such numbers = 10 + 100 = 110.
- **289.** When the second digit is 1, third digit can be 0, i.e. there is one such number.

When the second digit is 2, third digit can be 0 or 1, i.e. there are 2 such numbers.

When the second digit is 3, third digit can be 0, 1 or 2 i.e. there are 3 such numbers, and so on.

When the first digit is 7, second digit can be 1, 2, 3, 4, 5 or 6. So, there are

(1 + 2 + 3 + 4 + 5 + 6) = 21 such numbers between 700 and 799.

When the first digit is 8, second digit can be 1, 2, 3, 4, 5, 6 or 7. So, there are

(1 + 2 + 3 + 4 + 5 + 6 + 7) = 28 such numbers between 800 and 899.

When the first digit is 9, second digit can be 1, 2, 3, 4, 5, 6, 7 or 8. So, there are

(1 + 2 + 3 + 4 + 5 + 6 + 7 + 8) = 36 such numbers between 900 and 999.

Hence, the required number = (21 + 28 + 36) = 85.

- **290.** (a) In 183654729, 1836547 is not divisible by 7.
 - (b) In 381654729, 38 is divisible by 2, 381 is divisible by 3, 3816 is divisible by 4, 38165 is divisible by 5, 381654 is divisible by 6, 3816547 is divisible by 7, 38165472 is divisible by 8 and 381654729 is divisible by 9.
 - (c) In 983654721, 983 is not divisible by 3.
 - (d) In 981654723, 9816547 is not divisible by 7.
- 291. On dividing 11109999 by 1111, we get:

So, the required remainder is 1110.

1111)11109999(9999
9999

296. $\frac{\text{(Dividend)} - \text{(Remainder)}}{\text{Quotient}} = \text{Divisor.}$

:. Divisor =
$$\frac{(940-25)}{15} = \frac{915}{15} = 61$$
.

297. Remainder = 48, Divisor = $(5 \times 48) = 240$.

$$12 \times \text{Quotient} = \text{Divisor} \Rightarrow \text{Quotient} = \frac{240}{12} = 20.$$

Dividend = $(240 \times 20) + 48 = 4848$.

298. Quotient = 16, Divisor = $(25 \times 16) = 400$. $5 \times \text{Remainder} = \text{Divisor} \Rightarrow \text{Remainder} = \frac{400}{2} = 80$.

Dividend = $(400 \times 16) + 80 = 6480$.

- **299.** Divisor = (555 + 445) = 1000, Quotient = 2(555 445) = 2 × 110 = 220 and Remainder = 30.
 - \therefore Required number = $(1000 \times 220) + 30 = 220000 + 30 = 220030$.
- **300.** Divisor taken = 12, Quotient obtained = 35, Remainder = 0. \therefore Dividend = $(12 \times 35) = 420$.

Now, dividend = 420, divisor = 21, remainder = 0.

$$\therefore \text{ Quotient} = \frac{420}{21} = 20.$$

301. Divisor = 7 × quotient = 5 × remainder and Dividend = 6 × remainder.

$$\begin{array}{c}
5x) 6x (1) \\
\underline{5x} \\
\underline{x}
\end{array}$$

Let remainder be x. Then, divisor = 5x and dividend = 6x. On dividing 6x by 5x, we get 1 as quotient and x as remainder. \therefore Quotient = 1.

302. Since the required number is a 3-digit number, so on dividing by 19, it would yield a two-digit quotient which means that the quotient is greater than the remainder.

Let the remainder be x. Then, quotient = x + 9.

So, number
$$N = 19 (x + 9) + x = 20x + 171$$
.

 \therefore (N – 171) must be divisible by 20.

Clearly, (371 - 171) = 200, which is divisible by 20. Hence, the required number = 371.

303. Let the number be x. Let x when divided by 136 give q as quotient and 36 as remainder. Then, x = 136 q + 36 = 100 q

 $(17 \times 8q) + (17 \times 2) + 2 = 17 \times (8q + 2) + 2$. So, the given number when divided by 17 gives 2 as remainder.

304. Let the number be x and the quotient be q. Then, $x = 195 \ q + 47 = (15 \times 13 \ q) + (15 \times 3) + 2 = 15(13q + 3) + 2$. So, the given number when divided by $15\ \mathrm{gives}\ 2$ as remainder.

305. Let the number be x and the quotient be q.

Then,
$$x = 899 \ q + 63 = (29 \times 31q) + (29 \times 2) + 5 = 29 (31q + 2) + 5.$$

So, the given number when divided by $29 \ \text{gives} \ 5$ as remainder.

306. Let the number be x and on dividing by 5, we get q as quotient and 3 as remainder.

Then,
$$x = 5q + 3 \Rightarrow x^2 = (5q + 3)^2 = (25q^2 + 30q + 9)$$

= $5(5q^2 + 6q + 1) + 4$.

Thus, on dividing x^2 by 5, we get 4 as remainder.

307. Let the smaller number be x. Then, larger number

$$= (x + 1365).$$

 $\therefore x + 1365 = 6x + 15 \Rightarrow 5x = 1350 \Rightarrow x = 270.$

Hence, the smaller number = 270.

308. Let n = 4k + 3.

Then,
$$2n = 2(4k + 3) = 8k + 6 = 4 \times 2k + 4 \times 1 + 2 = 4(2k + 1) + 2$$
.

Thus, on dividing 2n by 4, we get 2 as remainder.

309. Let x = 13p + 11 and x = 17q + 9.

Then,
$$13p + 11 = 17q + 9 \Rightarrow 17q - 13p = 2 \Rightarrow q = \frac{2 + 13p}{17}$$

The least value of p for which $q = \frac{2+13p}{17}$ is a whole number, is p = 26.

$$\therefore x = (13 \times 26 + 11) = 338 + 11 = 349.$$

310. Let the dividend be (x + 71) and the divisor be y. Then, [2(x + 71) - 43] is divisible by $y \Rightarrow (2x + 142 - 43)$ is divisible by $y \Rightarrow (2x + 142 - 43)$

 \Rightarrow (2x + 99) is divisible by y.

: Divisor = 99

Shortcut Method:

Divisor =
$$(2 \times 71 - 43) = (142 - 43) = 99$$
.

311. Let $P = x + r_1$ and $Q = y + r_{2'}$ where each of x and y are divisible by the common divisor.

Then, $P + Q = (x + r_1) + (y + r_2) = (x + y) + (r_1 + r_2)$. (P + Q) leaves remainder r_3 when divided by the common divisor.

 \Rightarrow [(x + y) + ($r_1 + r_2$) - r_3] is divisible by the common divisor. Since (x + y) is divisible by the common divisor, so divisor = $r_1 + r_2 - r_3$.

- **312.** As proved in the above question, divisor = 4375 + 2986 2361 = 5000.
- **313.** The number is of the form (13k + 1), where k is of the form (5m + 3).
 - \therefore Number = 13k + 1 = 13 (5m + 3) + 1 = 65m + 40. Clearly when the number is divided by 65, we get 40 as remainder.
- **314.** Clearly, (2272 875) = 1397, is exactly divisible by *N*. Now, $1397 = 11 \times 127$.
 - $\mathrel{\dot{.}\,{.}}$ The required 3-digit number is 127, the sum of whose digits is 10.

Now, when order of divisors is reversed, we have:

13	2168
11	166 - 10
9	15 – 1
	1 – 6

:. Respective remainders are 10, 1 and 6.

When 137 is divided by 84, the remainder obtained is 53.

:. Required number = 5355.

Clearly, 10 when divided by 6, leaves a remainder 4.

319. Let the number be N = 2x + 1.

$$N^2 = (2x + 1)^2 = 4x^2 + 1 + 4x = 4x(x + 1) + 1.$$

Clearly, 4x (x + 1) is always divisible by 8 since one of x and (x + 1) is even which when multiplied by 4 is always divisible by 8.

Hence, required remainder = 1.

320. Sum of digits of numbers from 1 to 10 = 46.

Sum of digits of numbers from 11 to 20 = 56.

Sum of digits of numbers from 21 to 29 = 63.

Sum of digits of the given number = 46 + 56 + 63 = 165. So, the required remainder is the remainder obtained on dividing 165 by 9, which is 3.

- **321.** When *n* is even, $(x^n a^n)$ is divisible by (x + a).
 - \therefore (17²⁰⁰ 1²⁰⁰) is divisible by (17 + 1)
 - \Rightarrow (17²⁰⁰ 1) is divisible by 18
 - \Rightarrow On dividing 17^{200} by 18, we get 1 as remainder.
- **322.** $2^{31} = 2 \times 2^{30} = 2 \times (2^2)^{15} = 2 \times 4^{15}$.

When *n* is odd, $(x^n + a^n)$ is divisible by (x + a).

- \therefore (4¹⁵ + 1¹⁵) is divisible by (4 + 1)
- \Rightarrow (4 15 + 1) is divisible by 5 \Rightarrow (2 30 + 1) is divisible by 5
- \Rightarrow On dividing 2³⁰ by 5, we get (5 1) i.e. 4 as remainder.
- ... Remainder obtained on dividing 2³¹ by 5
- = Remainder obtained on dividing (2×4) i.e. 8 by 5 = 3.
- 323. Clearly,
 - (1) when n is odd, $(a^n + b^n)$ is divisible by (a + b). So, (1) is true.
 - (2) $(a^n b^n)$ is divisible by (a b) for all values of n. So, (2) is true.
- **324.** $(x^n a^n)$ is divisible by (x a) for all values of n.
 - \therefore (7¹⁹ 1¹⁹) is divisible by (7 1)
 - \Rightarrow (7¹⁹ 1) is divisible by 6
 - \Rightarrow On dividing (7¹⁹ + 2) by 6, remainder obtained = 3.
- **325.** $(10^{12} + 25)^2 (10^{12} 25)^2 = 4 \times 10^{12} \times 25$

$$[:: (a + b)^2 - (a - b)^2 = 4ab]$$

 $= 10^{12} \times 100 = 10^{12} \times 10^2 = 10^{14}$.

Hence, n = 14.

326. $(3^{25} + 3^{26} + 3^{27} + 3^{28}) = 3^{25} (1 + 3 + 3^2 + 3^3)$

$$= 3^{25} (1 + 3 + 9 + 27) = 3^{25} \times 40$$

$$= (3 \times 10) \times (3^{24} \times 4) = 30 \times (3^{24} \times 4),$$

which is divisible by 30.

327. $(4^{61} + 4^{62} + 4^{63} + 4^{64}) = 4^{61} (1 + 4 + 4^2 + 4^3) = 4^{61} \times 85$, which is divisible by 17.

328. $(x^n - a^n)$ is divisible by (x - a) for all values of n

- $(9^6 1^6)$ is divisible by (9 1)
- \Rightarrow (9⁶ 1) is divisible by 8
- \Rightarrow On dividing (9⁶ + 1) by 8, we get 2 as remainder.
- **329.** When *n* is even, $(x^n a^n)$ is divisible by both (x a) and (x + a).

So, $(6^n - 1)$ is divisible by both (6 - 1) and (6 + 1)

- \Rightarrow (6ⁿ 1) is divisible by both 5 and 7
- \Rightarrow (6ⁿ 1) is divisible by (5 × 7), i.e. 35.

[:: 5 and 7 are co-primes]

- **330.** $(x^n + a^n)$ is divisible by (x + a) when n is odd.
 - \therefore (12ⁿ + 1) is divisible by (12 + 1) i.e. 13 when n is odd.
- **331.** $(x^n + a^n)$ is divisible by (x + a) when n is odd.
 - \therefore (25²⁵ + 1²⁵) is divisible by (25 + 1)
 - \Rightarrow (25²⁵ + 1) is divisible by 26
 - \Rightarrow On dividing 25²⁵ by 26, we get (26 1) = 25 as remainder.

332. $(x^n + a^n)$ is divisible by (x + a) when n is odd.

- \therefore (67⁶⁷ + 1⁶⁷) is divisible by (67 + 1)
- \Rightarrow (67⁶⁷ + 1) is divisible by 68
- \Rightarrow On dividing $(67^{67} + 67)$ by 68, we get (67 1) = 66 as remainder.
- **333.** $(49^{15} 1) = (7^2)^{15} 1 = 7^{30} 1$.

Now, when n is even, $(x^n - a^n)$ is divisible by both (x - a) and (x + a).

 \therefore (7³⁰ – 1) is divisible by both (7 – 1) and (7 + 1) i.e. by both 6 and 8. Thus, [(49)¹⁵ – 1] is divisible by both 6 and 8.

334. $7^{84} = (7^3)^{28} = (343)^{28}$.

Now, $(x^n - a^n)$ is divisible by (x - a) for all values of n.

- \therefore [(343)²⁸ 1] is divisible by (343 1)
- \Rightarrow [(343)²⁸ 1] is divisible by 342
- \Rightarrow (7⁸⁴ 1) is divisible by 342
- \Rightarrow On dividing 7^{84} by 342, we get 1 as remainder.
- **335.** $2^{60} = (2^2)^{30} = 4^{30}$.

When *n* is even, $(x^n - a^n)$ is divisible by (x + a).

- $(4^{30} 1^{30})$ is divisible by (4 + 1)
- \Rightarrow (4³⁰ 1) is divisible by 5 \Rightarrow (2⁶⁰ 1) is divisible by 5.
- \Rightarrow On dividing 2⁶⁰ by 5, we get 1 as remainder.
- **336.** $(2^{12} 1) = (4096 1) = 4095$, which is clearly divisible by 3, 5, 7 and 13 i.e. four numbers in all.
- **337.** $(x^n + a^n)$ is divisible by (x + a) when n is odd.
 - \therefore (15²³ + 23²³) is divisible by (15 + 23)

- \Rightarrow (15²³ + 23²³) is divisible by 38 and hence by 19
- \Rightarrow On dividing (15²³ + 23²³) by 19, we get 0 as remainder.
- **338.** When *n* is even, $(x^n a^n)$ is divisible by (x + a).

Now,
$$2^{256} = (2^4)^{64} = (16)^{64}$$
.

- \therefore (16⁶⁴ 1⁶⁴) is divisible by (16 + 1)
- \Rightarrow (16⁶⁴ 1) is divisible by 17
- \Rightarrow (2²⁵⁶ 1) is divisible by 17
- \Rightarrow On dividing 2^{256} by 17, we get 1 as remainder.
- **339.** When *n* is even, $(x^n a^n)$ is divisible by both (x a) as well as (x + a).

Now,
$$(7^{6n} - 6^{6n}) = [(7^3)^{2n} - (6^3)^{2n}] = [(343)^{2n} - (216)^{2n}].$$

- \therefore (7⁶ⁿ 6⁶ⁿ) is divisible by both (7 6) and (7 + 6)
- \Rightarrow (7⁶ⁿ 6⁶ⁿ) is divisible by 13.

And, $[(343)^{2n} - (216)^{2n}]$ is divisible by both (343 - 216) and (343 + 216)

- \Rightarrow (7⁶ⁿ 6⁶ⁿ) is divisible by both 127 and 559.
- **340.** Let $2^{32} = x$. Then, $(2^{32} + 1) = (x + 1)$.

Let (x+1) be completely divisible by the natural number N. Then, $(2^{96}+1)=[(2^{32})^3+1]=(x^3+1)=(x+1)$ (x^2-x+1), which is completely divisible by N since (x+1) is divisible by N.

341. $(2^{48} - 1) = [(2^6)^8 - 1] = (64)^8 - 1.$

When n is even, $(x^n - a^n)$ is completely divisible by both (x - a) and (x + a).

- \therefore (64⁸ 1⁸) is divisible by both (64 1) and (64 + 1)
- \Rightarrow (2⁴⁸ 1) is divisible by both 63 and 65.

342.
$$n^{65} - n = n (n^{64} - 1) = n(n^{32} - 1) (n^{32} + 1)$$

 $= n (n^{16} - 1) (n^{16} + 1) (n^{32} + 1)$
 $= n (n^8 - 1) (n^8 + 1) (n^{16} + 1) (n^{32} + 1)$
 $= n (n^4 - 1) (n^4 + 1) (n^8 + 1) (n^{16} + 1) (n^{32} + 1)$
 $= n (n^2 - 1) (n^2 + 1) (n^4 + 1) (n^8 + 1) (n^{16} + 1) (n^{32} + 1)$
 $= (n - 1) n (n + 1) (n^2 + 1) (n^4 + 1) (n^8 + 1)$
 $= (n^{16} + 1) (n^{32} + 1)$

Clearly, (n-1), n and (n+1) are three consecutive numbers and they have to be multiples of 2, 3 and 4 as n is odd.

Thus, the given number is definitely a multiple of 24.

343. Let a = 55, b = 17.

Then,
$$N = a^3 + b^3 - (a + b)^3 = a^3 + b^3 - [a^3 + b^3 + 3ab (a + b)]$$

= $-3ab (a + b) = -3 \times 55 \times 17 \times 72$.

Clearly, N is divisible by both 3 and 17.

344. Taking out $\lfloor 10 \rfloor$ common from $\lfloor 10 \rfloor + \lfloor 11 \rfloor + \dots + \lfloor 100 \rfloor$, we get this expression in the form of a multiple of $\lfloor 10 \rfloor$ which has zeros as its last two digits. So, the last two digits of the expression $\lfloor 10 \rfloor + \lfloor 11 \rfloor + \dots + \lfloor 100 \rfloor$ are zeros.

Thus, the last two digits of N must be the last two digits of the sum $(\underline{1} + \underline{12} + \dots + \underline{9})$.

Now, $\lfloor 1 + \lfloor 2 + \dots + \lfloor 9 = 1 + 2 + 6 + 24 + 120 + 720 + 5040 + 40320 + 362880$ It has clearly 13 as the last two digits.

So, the last two digits of N are 13.

345. $168 = 2^3 \times 3 \times 7$ and $|\underline{7} = 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 7 \times 5 \times 3^2 \times 2^4 = 168 \times 30$ Hence, $|\underline{7}|$ and all the factorials greater than $|\underline{7}|$ are divisible by 168.

Now,
$$N = |\underline{1} + |\underline{2} + |\underline{3} + \dots + |\underline{99} + |\underline{100}|$$

$$= [1 + 2 + 3 + 4 + 5 + 6 + a]$$
 multiple of 168.

So, the remainder obtained on dividing N by 168 is the same as that obtained on dividing $(\underline{1} + \underline{12} + \underline{13} + \underline{14} + \underline{15} + \underline{16})$ by 168.

Now, $|\underline{1} + |\underline{2} + |\underline{3} + |\underline{4} + |\underline{5} + |\underline{6}| = 1 + 2 + 6 + 24 + 120 + 720$ = $873 = (168 \times 5) + 33$.

Hence, the required remainder is 33.

346. $4^{61} = 4 \times 4^{60} = 4 \times (4^4)^{15} = 4 \times (256)^{15}$.

Now, $(x^n - a^n)$ is divisible by (x - a) for all values of n. $\therefore (256^{15} - 1)$ is divisible by (256 - 1) i.e. 255 and hence by 51.

- \Rightarrow On dividing (256)¹⁵ by 51, we get 1 as remainder
- \Rightarrow On dividing 4^{60} by 51, we get 1 as remainder
- \Rightarrow On dividing 4⁶¹ by 51, remainder obtained = $(4 \times 1) = 4$.
- **347**. $17^{36} = (17^2)^{18} = (289)^{18}$.

Now, $[(289)^{18} - 1]$ is divisible by (289 - 1), i.e. 288

- \Rightarrow (17³⁶ 1) is divisible by 288 and hence by 36
- \Rightarrow On dividing 17³⁶ by 36, we get 1 as remainder.
- **348.** When *n* is odd, $(x^n + a^n)$ is always divisible by (x + a). ∴ Each one of $(47^{43} + 43^{43})$ and $(47^{47} + 43^{47})$ is divisible by (47 + 43).
- 349. Product of all odd natural numbers less than 5000

$$= 1 \times 3 \times 5 \times 7 \times \dots \times 4999$$

$$= \frac{1 \times 2 \times 3 \times 4 \times 5 \times 6 \times \dots \times 5000}{2 \times 4 \times 6 \times 8 \times \dots \times 5000}$$

$$= \frac{5000!}{2^{2500} (1 \times 2 \times 3 \times 4 \times \dots \times 2500)} = \frac{5000!}{2^{2500} . 2500!}$$

350. The pages of the book may be divided into 10 groups: (1-100), (101-200), (201-300),....., (901-1000).

Clearly, for the first group, one needs 11 zeros.

For second to ninth groups, one needs 20 zeros each.

For the tenth group, one needs 21 zeros.

So, total number of zeros required = $11 + 8 \times 20 + 21 = 192$.

351. $a^2 + b^2 + c^2 = 1$.

So, the maximum value of
$$a^2$$
 b^2 $c^2 = \left(\frac{1}{3} \times \frac{1}{3} \times \frac{1}{3}\right) = \frac{1}{27}$.

 $(\because$ when sum of three positive quantities is fixed, the product will be maximum when the quantities are equal)

Hence, maximum value of $abc = \frac{1}{\sqrt{27}} = \frac{1}{3\sqrt{3}}$.

352. Let $N = 1^5 + 2^5 + 3^5 + \dots + (100)^5$.

Then,
$$N = (1^5 + 2^5 + 3^5 + \dots + 10^5) + (11^5 + 12^5 + \dots + 20^5) + (21^5 + 22^5 + \dots + 30^5) + \dots + (91^5 + 92^5 + \dots + 100^5) = N_1 + N_2 + N_3 + \dots + N_{10}.$$

Since each one of N_1 , N_2 , N_3 ,, N_{10} has the same

unit's digit of its terms, so unit's digit of each one of N_1 , $N_2,....$, N_{10} is also the same.

 \therefore Unit's digit in $N = 10 \times$ Unit's digit of $N_1 = 0$.

353. Clearly, each of the 38 terms $\left(\frac{1}{4}\right)\left(\frac{1}{4} + \frac{1}{50}\right)\left(\frac{1}{4} + \frac{2}{50}\right)$, $\left(\frac{1}{4} + \frac{37}{50}\right)$ has a value lying between 0 and 1, while each one of the 12 terms $\left(\frac{1}{4} + \frac{38}{50}\right) \cdot \left(\frac{1}{4} + \frac{39}{50}\right) \dots \left(\frac{1}{4} + \frac{49}{50}\right)$ has a value lying between 1 and 2

Hence, the given expression = $(0 \times 38) + (1 \times 12) = 12$.

354.
$$100^{25} - 25 = (10^2)^{25} - 25 = 10^{50} - 25$$

= $1000 \dots 00 - 25 = 9999 \dots 9975$
 48 times

 \therefore Sum of digits = $(48 \times 9) + 7 + 5 = 432 + 7 + 5 = 444$.

355. $(1024)^4 \times (125)^{11} = (2^{10})^4 \times (5^3)^{11} = 2^{40} \times 5^{33} = 2^7 \times (2^{33} \times 10^{10})^{11} = 2^{10} \times 10^{10}$ 5^{33}) = $2^7 \times 10^{33} = 128 \times 10^{33}$.

Clearly, the number has 1, 2, 8 and thirty-three zeros, i.e. (3 + 33) = 36 digits in all.

356. From 300 to 399, we note that when '4' comes only one time = 19 such instances.

From 400 to 499, we note that when '4' comes only one time = 80 such instances.

So, total = (19 + 80) = 99 such instances

- **357.** $21 = 3 \times 7$ is not a prime number because 21 is a composite
- **358.** Given x = a (b c), y = b (c a); z = (a b)x = a (b - c)

$$\Rightarrow \frac{x}{a} = b - c \dots (i)$$
Similarly, $y = b (c - a)$

$$\Rightarrow \frac{y}{b} = c - a$$
 (ii) and similarly $z = c(a - b)\frac{z}{c} = c - a$ (iii)

Adding (i), (ii) and (iii) we get

$$\therefore \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = b - c + c - a + a - b = 0$$

$$\Rightarrow \frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 0$$

$$\therefore \left(\frac{x}{a}\right)^3 + \left(\frac{y}{b}\right)^3 + \left(\frac{z}{c}\right)^3$$

$$=3\times\frac{x}{a}\times\frac{y}{b}\times\frac{z}{c}=\frac{3xyz}{abc}$$

[If
$$a + b + c = 0$$
, $a^3 + b^3 + c^3 = 3 abc$]

- 359. Every real number is a rational number is not a correct statement.
- **360.** Given

$$a + b + c = 6$$

$$ab + bc + ca = 10$$

$$ab + bc + ca = 10$$

$$\therefore (a + b + c)^{2} = 36$$

$$\Rightarrow a^{2} + b^{2} + c^{2} + 2ab + 2bc + 2ca = 36$$

$$\Rightarrow a^{2} + b^{2} + c^{2} + 2 (ab + bc + ca) = 36$$

$$\Rightarrow a^{2} + b^{2} + c^{2} + 2 \times 10 = 36$$

$$\Rightarrow a^{2} + b^{2} + c^{2} = 16$$
As we know
$$\frac{a^{3} + b^{3} + c^{3} - 3abc}{a^{2} + b^{2} + c^{2} - ab - bc - ca} = (a + b + c)$$

$$\frac{a^3 + b^3 + c^3 - 3abc}{16 - (ab + bc + ca)} = 6$$

$$\Rightarrow \frac{a^3 + b^3 + c^3 - 3abc}{16 - 10} = 6$$

$$\Rightarrow a^3 + b^3 + c^3 - 3abc = 6 \times 6$$
$$\Rightarrow a^3 + b^3 + c^3 - 3abc = 36$$

361. Let the blank space is x

$$\therefore 1001 \times 111 = 110000 + 11x$$

Now find the value of x

$$(1000 + 1) \times 111 = 110000 + 11x$$

$$111000 + 111 = 110000 + 11x$$

$$1111111 = 110000 + 11x$$

$$11x = 111111 - 110000$$

$$11x = 1111$$

$$x = \frac{1111}{11} = 101$$

362. The place value of 5 in 15201 = 5000

Place value of 6 in 2659 = 600

$$\therefore$$
 we have $5000 + 600 = 7x$

$$7x = 5600$$

$$x = \frac{5600}{7} = 800$$

363. Let the two – digit number be 10a + b where a > bAccording to the question,

a + b = 12(i)

$$a - b = 6....(ii)$$

On adding equation (i) and (ii).

$$2a = 19$$

$$\Rightarrow a = 9$$

From equation (i),

$$9 + b = 12$$

$$\Rightarrow b = 12 - 9 = 3$$

 \therefore Number is 10a + b

$$= 9 \times 10 + 3 = 93$$

- \therefore When a < b. Then required number is = 39
- 364. Greatest four digit number that begins with 3 and ends with 5 = 3995

Least four digit number that begins with 3 and ends with 5 = 3005

$$\Rightarrow (p-q)(p^2+q^2-pq) = (p-q)\{(p-q)^2 - xpq\}$$
$$\{\because a^3 - b^3 = (a-b)(a^2 - ab + b^2)\}$$
by cancelling same terms of both sides

$$\Rightarrow p^2 + q^2 - pq = p^2 + q^2 - 2pq - xpq$$

$$\left\{ \left(a - b^2\right) = a^2 + b^2 - 2ab \right\}$$

$$\Rightarrow pq = -xpq$$

$$\Rightarrow x = -1$$

367. 2361*48 will be divisible by 9 if the sum of the digits of the given number is divisible by 9. 2 + 3 + 6 + 1 + * + 4 + 8 i.e. (24 + *) is divisible by 9.

Clearly, * = 3 because 27 is divisible by 9.

368. Time taken by A to complete colouring a picture = $\frac{3}{4}$ hours = 0.75 hours

Time taken by B to complete colouring a picture $\frac{7}{12}$ = hours = 0.58 hours

Time taken by C to complete colouring a picture $\frac{5}{8}$ = hours = 0.625 hours

Time taken by D to complete colouring a picture $\frac{6}{7}$ = hours = 0.85 hours

Hence, B took least time in colouring the picture.

369. Let number be aAccording question, $\frac{4}{5}$ of a - 45% of a = 56 $\frac{4}{5}a - \frac{45}{100} \times a = 56$

$$\frac{35a}{100} = 56 \Rightarrow a = \frac{100 \times 56}{35}$$

$$\Rightarrow a = 160$$

$$= 65\% \text{ of } a = \frac{65}{100} \times 160 = 104$$

370. Given x + y : y + z : z + x = 6 : 7 : 8

$$\frac{x+y}{6} = \frac{y+z}{7} = \frac{z+x}{8} = a$$

$$\Rightarrow x + y = 6a \dots (i)$$

$$y + z = 7a$$
 ...(ii)

$$z + x = 8a$$
 ...(iii)

On adding all three equations

$$x + y + y + z + z + x = 6a + 7a + 8a$$

$$\Rightarrow 2(x+y+z)=21a$$

$$\Rightarrow$$
 2×14 = 21a [: $x + y + z = 14$]

$$\therefore a = \frac{2 \times 14}{21} = \frac{4}{3}$$

$$x + y = 6a = 6 \times \frac{4}{3} = 8$$

$$\therefore z = (x+y+z)-(x+y)$$

$$= 14 - 8 = 6$$

371. A megabyte is 1.048, 576 bytes or 1,024 kilobytes. It conveniently expression the binary multiples inherent in digital computer memory architectures. However, megabyte architectures. However, megabyte is also taken to mean 1000 × 1024 (1024000) bytes.

372. The first 3-digit number which is divisible by 9 is 108 and last three digit number which is divisible by 9 is 999.

So, we have an AP with
$$a = 108$$
, $d = 9$ and $a_n = 999$

$$\therefore a_n = a + (n-1)d$$

$$\Rightarrow$$
 999 = 108 + (n - 1) 9

$$\Rightarrow$$
 999 - 108 = $(n - 1)$ 9

$$\Rightarrow 891 = (n-1) 9$$

$$\Rightarrow (n-1) = \frac{891}{9} = 99$$

$$\Rightarrow n + 99 + 1 = 100$$

373. Let, the two consecutive even numbers are a and (a + 2), respectively

According to question,

$$a^{2} + (a+2)^{2} = 1060 \left\{ \because (a+b)^{2} = a^{2} + b^{2} + 2ab \right\}$$

$$\Rightarrow a^{2} + a^{2} + 4 + 4a = 1060$$

$$\Rightarrow 2a^{2} + 4a - 1056 = 0$$

$$\Rightarrow a^{2} + 2a - 528 = 0$$

$$\Rightarrow a^{2} + 24a - 22a - 528 = 0$$

$$\Rightarrow a(a+24) - 22(a+24) = 0$$

$$\Rightarrow (a-22)(a+24) = 0$$

- 374. The data in both the statements I and II are not sufficient to answer the question.
- **375.** Given $n = p_1^{x_1} p_2^{x_2} p_3^{x_3}$ where p_1, p_2, p_3 are distinct prime

Number of prime factors form = $(x_1 \times x_2 \times x_3) = x_1 \times x_2 \times x_3$ Hence, option (b) is correct

376. 11, 111, 1111, 11111,

 $\Rightarrow a = -24, 22$

Let
$$m=2 \Rightarrow 4 \times 2 + 3 = 11$$

$$m=27 \Rightarrow 4 \times 27 + 3 = 111$$

Each number can be expressed in the form (4m + 3) where *m* is a natural number

Hence, statement 1 is only correct.

377. Maximum daily wages of an officers

Illustration:

$$\begin{array}{r}
 3894 \overline{\smash)4956} \\
 3894 \\
 \hline
 3894 \\
 \hline
 3186 \\
 \hline
 708 \overline{\smash)1062} \\
 \hline
 708 \\
 \hline
 354 \overline{\smash)708} \\
 708
 \end{array}$$

Maximum daily wages of an officer = ₹ 354

Number of Maximum days to attend the duty = $\frac{4956}{354}$ = 14

Number of days present on duty = $\frac{3894}{354} = 11$

Number of absent days = 14 - 11 = 3 days

378. Let, the two natural numbers be a and b According to given information

$$\therefore a^2 - b^2 = 19$$

$$\Rightarrow (a+b) (a-b) = 19 \times 1$$

$$\Rightarrow a+b = 19 \dots (i)$$

$$a-b=1 \dots (ii)$$
On adding,
$$2a = 20$$

$$\Rightarrow a = 10$$

From equation (i),

$$\therefore 10 + b = 19$$

$$\Rightarrow b = 19 - 10 = 9$$

$$\therefore a^2 + a^2 = (10)^2 + (9)^2$$

$$= 100 + 81 = 181$$

379. Let the two numbers be are a and b

$$\therefore$$
 $a + b = 14$ (i)
 $a - b = 10$...(ii)
By adding equation (i) and (ii) we get $2a = 24$

∴ a = 12 and b = 2∴ product of these two numbers = $12 \times 2 = 24$

380. Let A is to be added then
$$2x^2 + 3x - 5 + A = x^2 + x + 1$$

$$\Rightarrow A = x^2 - x + 1 - (2x^2 + 3x - 5) \Rightarrow A = x^2 - x + 1 - 2x^2 - 3x + 5$$

$$= -x^2 - 4x + 4$$
